I ran an autonomous GTM agent for 90 days _

The vendor pitch promised outbound that runs itself. Here's the part not in the demo.

RUN SESSION _

```
arhem@verydian:~/the upside$ step 2
```

The lift was real, roughly

The pitched 4 to 7x conversion gain over manual SDR work showed up once the system found its rhythm.

```
arhem@verydian:~/the real cost$ step 3
```

The first three weeks were not in the demo

Lead scoring flagged competitors doing recon as high-intent buyers. You only catch that by watching daily.

MANUALLY

```
arhem@verydian:~/the friction point$ step 4
```

One touchpoint sat outside the agent's orbit

It owned first touch, follow up, and sequencing. One pricing question made it stall or answer wrong.

```
arhem@verydian:~/the override$ step 5
```

One rule fixed most of the risk

Any reply with a question mark or a pricing word routes to a human within the hour, no exceptions.

Autonomous doesn't mean unattended

It means the agent runs the 80% and tells you exactly when it
needs the 20%.
