SCHEDULING BUG

My scheduler thought New York never changed its clocks

That was true until August 1. New York's clocks went back this weekend, and the same 03:00 slot moves by an hour in UTC.

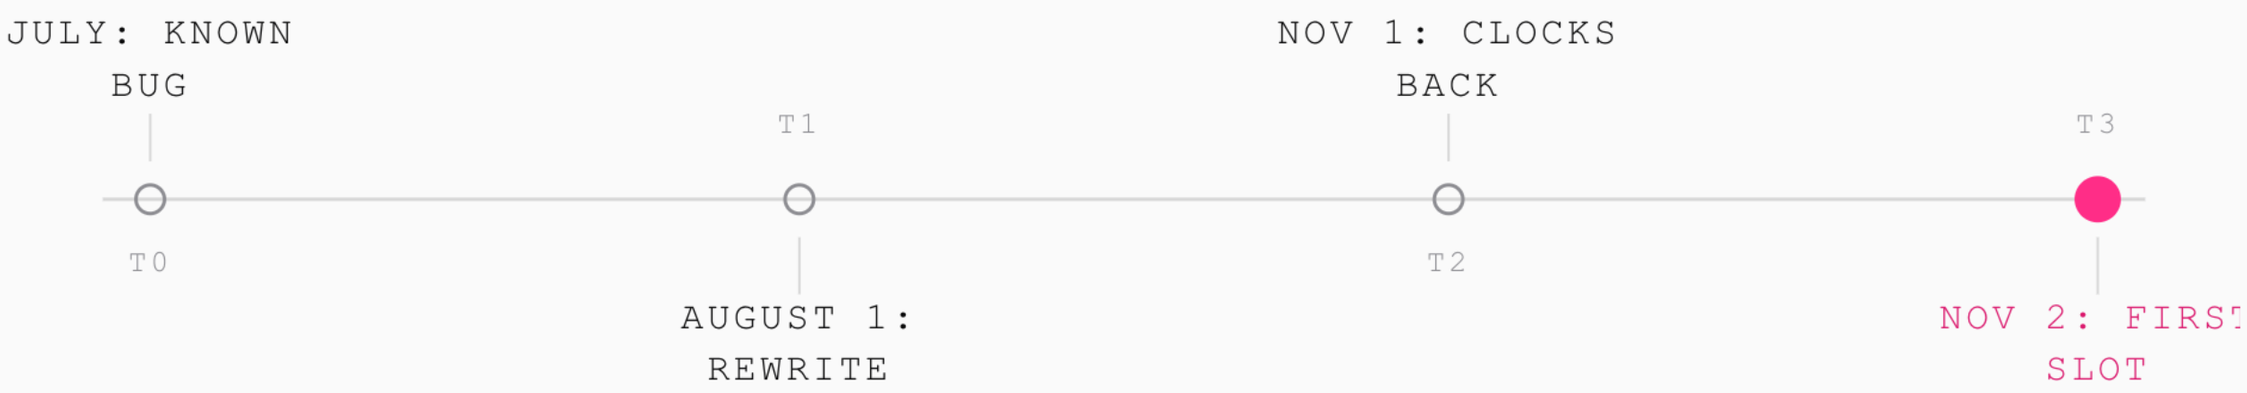

SWIPE

FOUR DATES

02/06

The August fix meets its first real clock change

The handoff logged fixed offsets as a known bug in July. I rewrote buildDueAt() on August 1. NIST ends daylight time at 2 a.m. on November 1, the first live boundary since.

THE ARITHMETIC

03/06

A fixed -5 offset lands an hour late in daylight time

Minus five hours is the standard-time offset. Applied to a daylight-time Monday's 03:00 slot, it gives 08:00Z instead of the real 07:00Z.

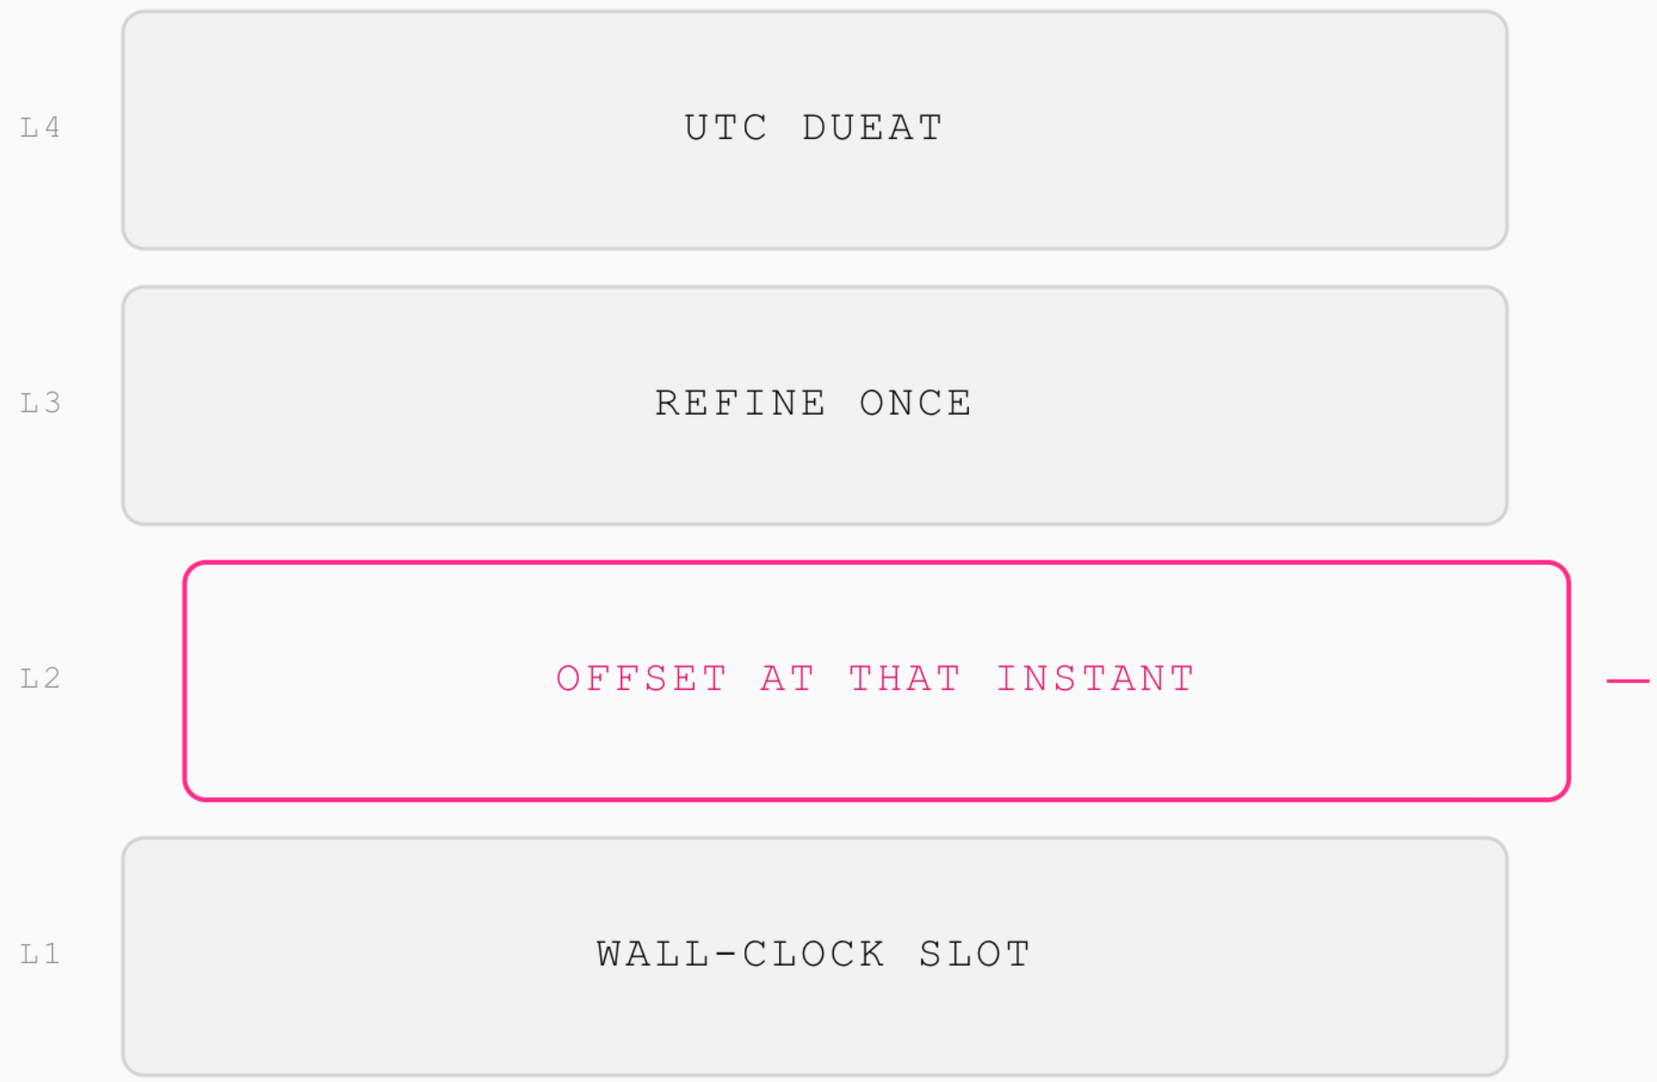

THE REWRITE

04/06

The fix: ask the zone, don't do the arithmetic

buildDueAt() builds the wall-clock time, asks the time zone for its offset at that instant, refines once for DST boundaries, then emits UTC.

TWO STRINGS

05/06

Same 03:00 Monday slot. One hour apart in UTC.

The first value was read back from Buffer. The second is what my function returns for the first slot after the change.

```
$  W44 READ BACK FROM BUFFER

$  2026-10-26T07:00:00Z

$  W45 FUNCTION RETURNS

>  2026-11-02T08:00:00Z
```

Read it back from the system of record

A clock change is a good day to check one scheduled time against the real thing.

CHECK ONE TIMESTAMP
