Three Failures No Alert Will Catch

Silent, expensive, and completely avoidable

01 Your team copies data between systems daily

02 Decisions wait on a person, not data

03 You've automated tasks but not workflows

IF YES TO ANY →
You need an agent, not another app.

□

2 It Worked in Staging

Three weeks post-launch, costs tripled. No errors, no alerts. Just different behavior accumulating until an invoice made it undeniable. This is a pattern, not a one-off.

SYS.NODES

0

3 Failure 1: Silent Provider Drift

Providers update base models without changing the API name. Same endpoint, different model. Routing logic breaks quietly. Costs shift. No errors surface.

COMPARISON

0

4 Fix: Pin to Model ID, Not API Name

Version-pin at the model ID level. Add behavioral regression tests running against production endpoints weekly. Catch drift before the invoice does.

5

Failure 2: No Per-Request Structured Logs

Multi-agent incidents require full traces: agent, input, output, latency, cost. Without them, debugging is archaeology. You're guessing from indirect signals.

6 Failure 3: Governance Added After the First Incident

Retrofitting governance onto a live system is ten times the work. Define approval thresholds, rate limits, and audit requirements before first production deployment.
