HUMAN-PACED SYSTEMS

Anthropic's bottleneck is no longer the code

It merged over 30,000 changes a day in September. The slow part is everything built for human scale.

ENTER

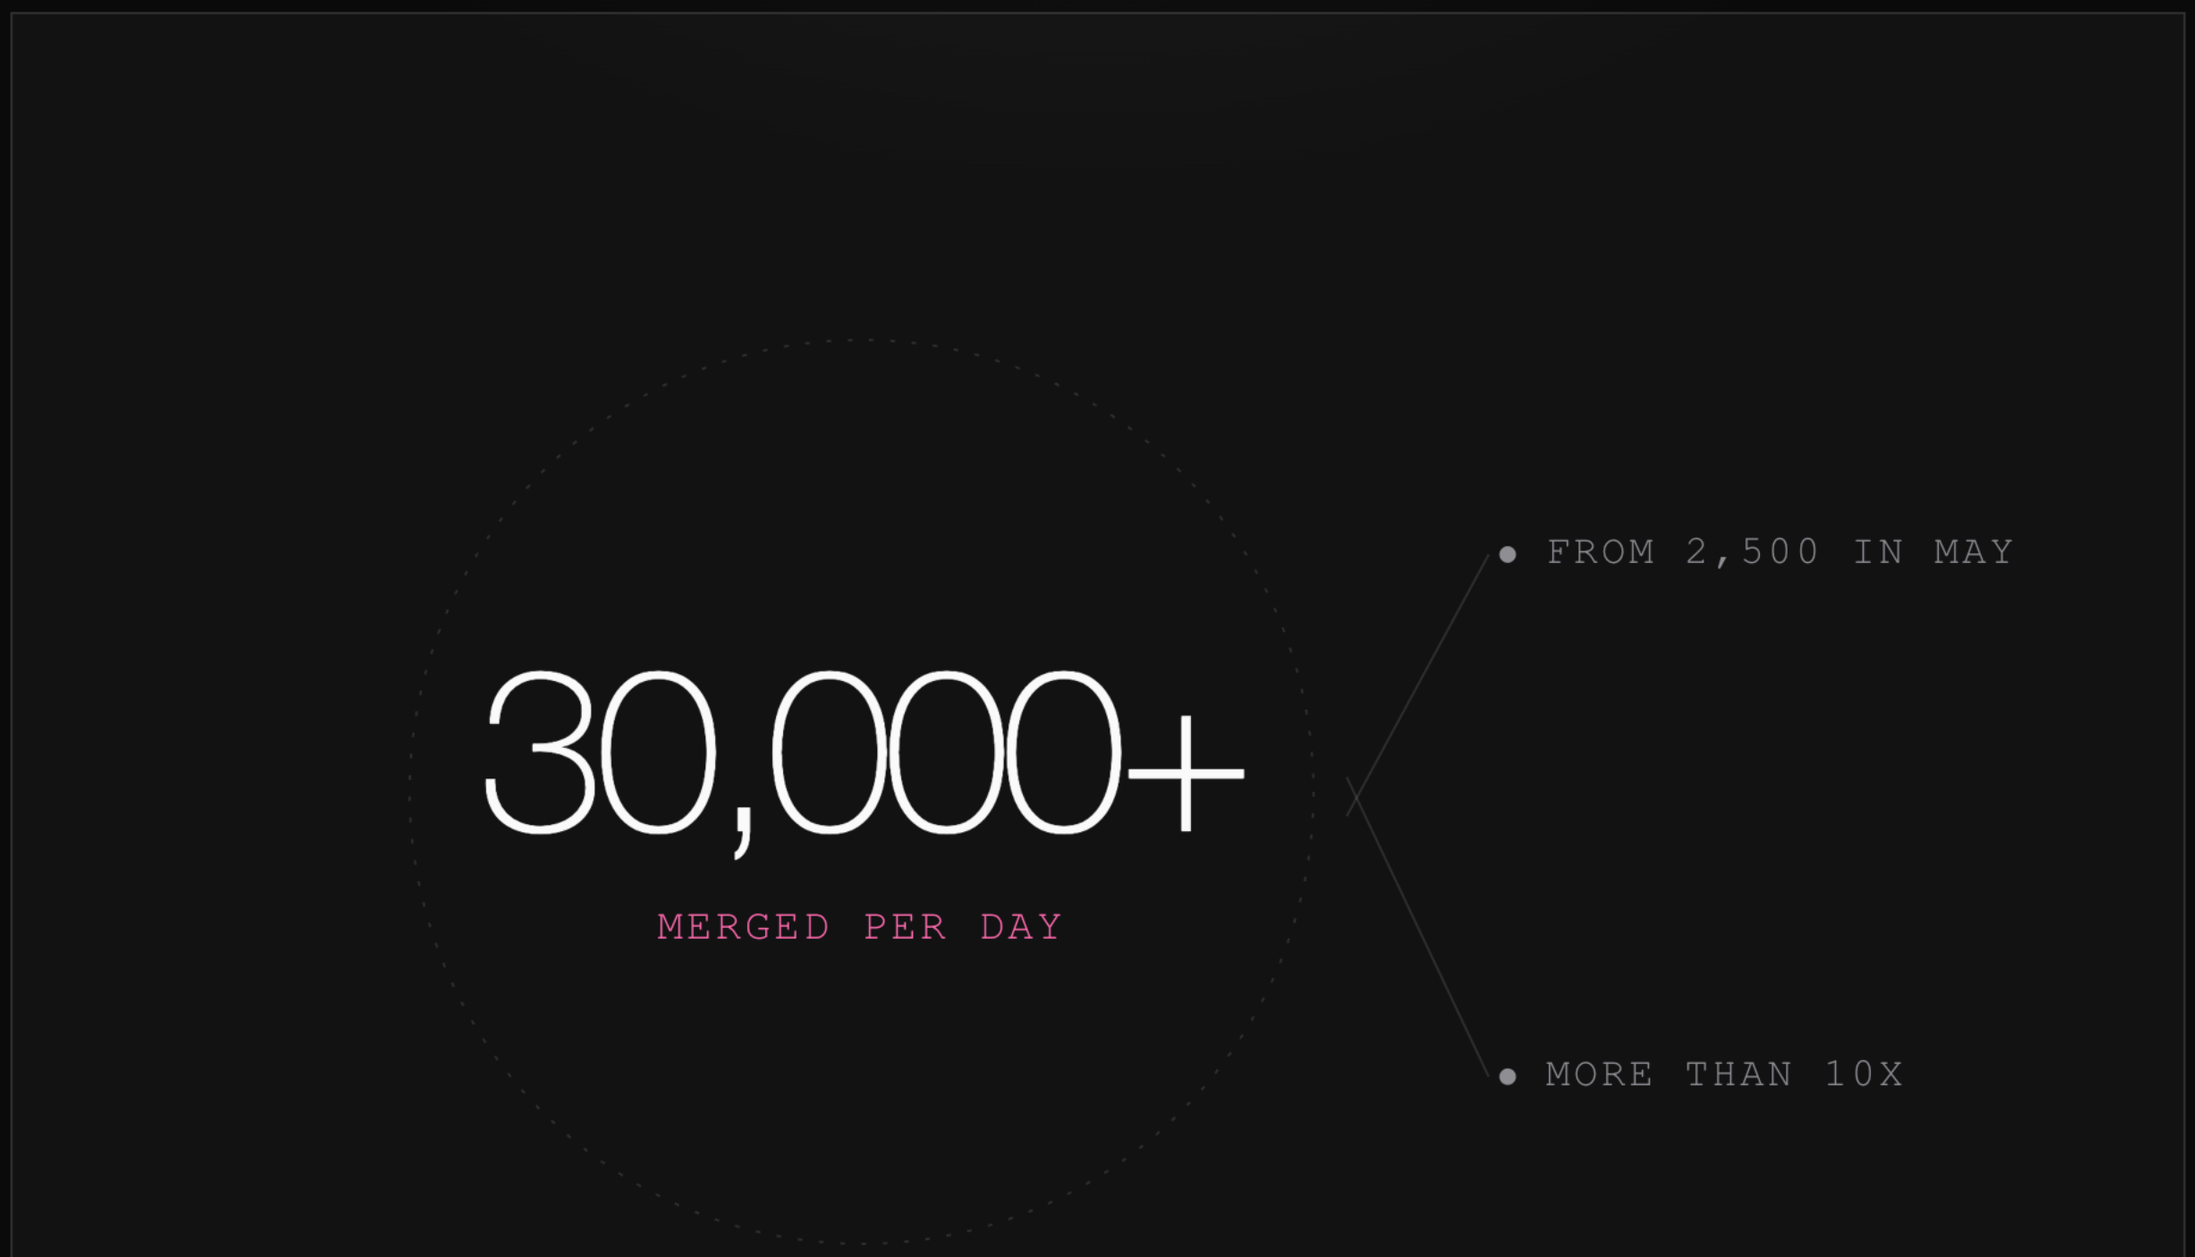

EXHIBIT 02 · THE VOLUME

From 2,500 merges a day to 30,000

Anthropic's own figures: around 2,500 code changes merged per day in May 2026, over 30,000 per day as of September. That is more than 10x.

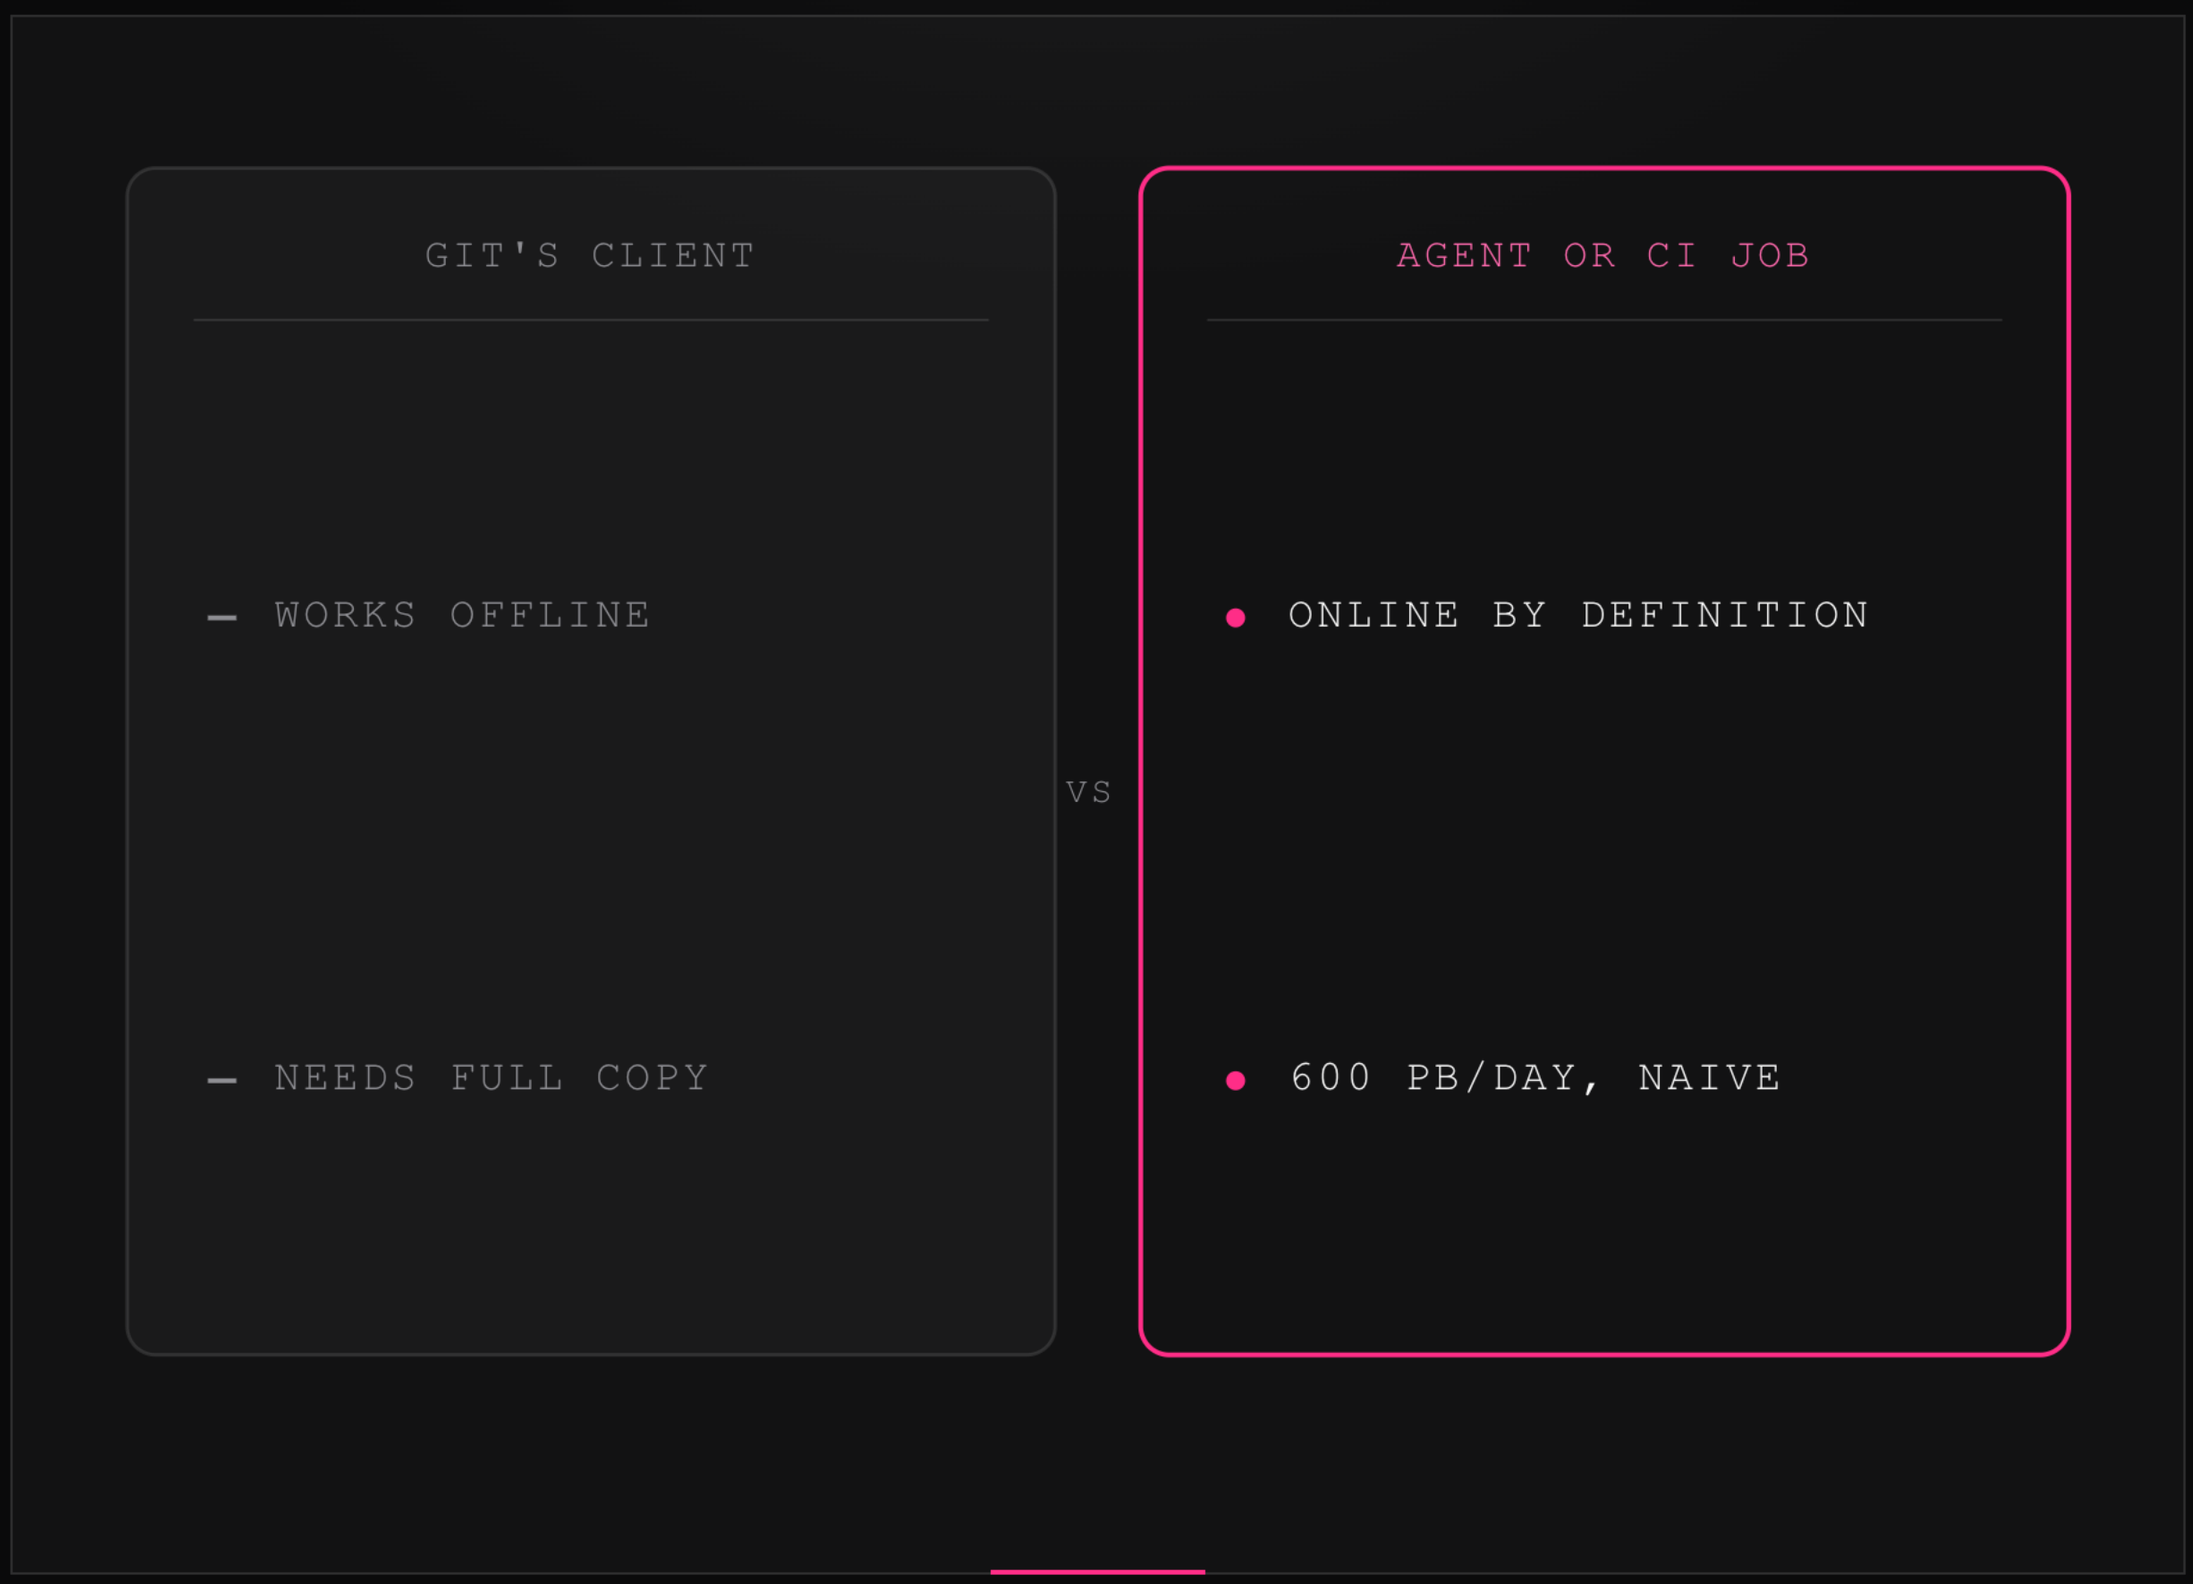

EXHIBIT 03 · CLIENT MISMATCH

Git assumes offline clients. Agents are always online.

Git assumes clients work offline and need a full copy. Anthropic's clients are mostly online agents and jobs. Naive fetching: over 600 PB of git traffic a day, its own arithmetic, not measured.

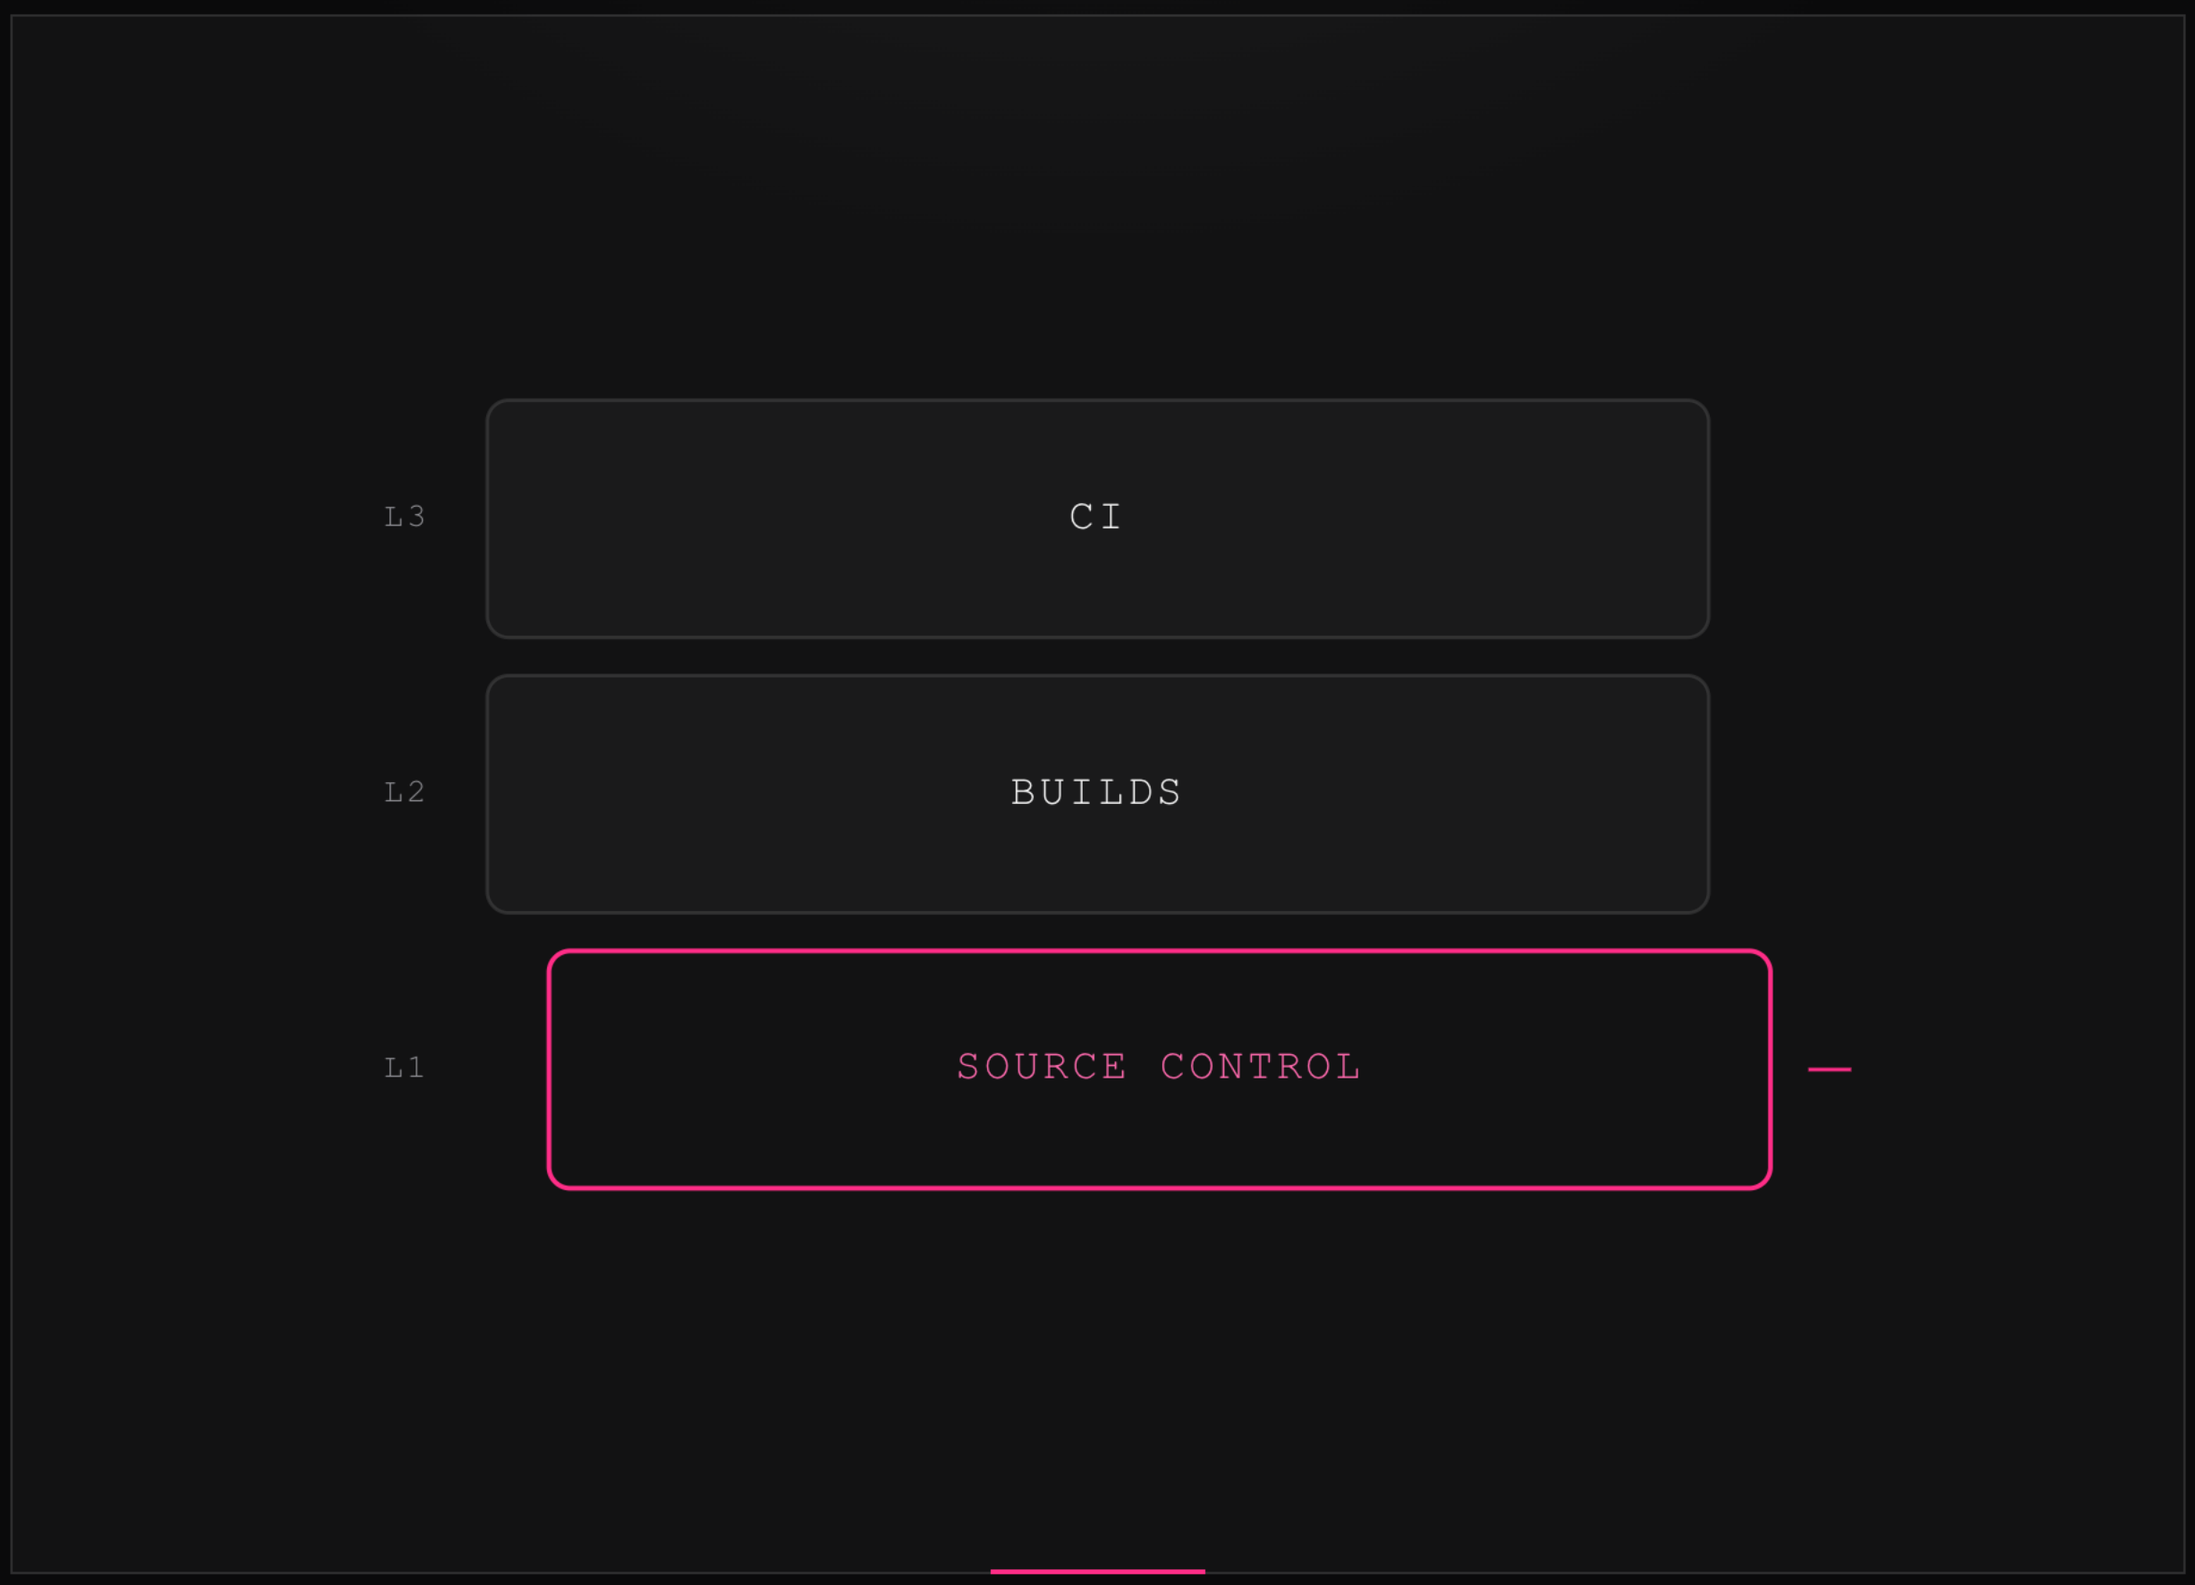

EXHIBIT 04 · THE LAYERS

Source control, builds and CI were sized for people

Anthropic's list of human-scale infrastructure. Its fix: a new source control system and code review tool, built by seven people and migrated to in five months.

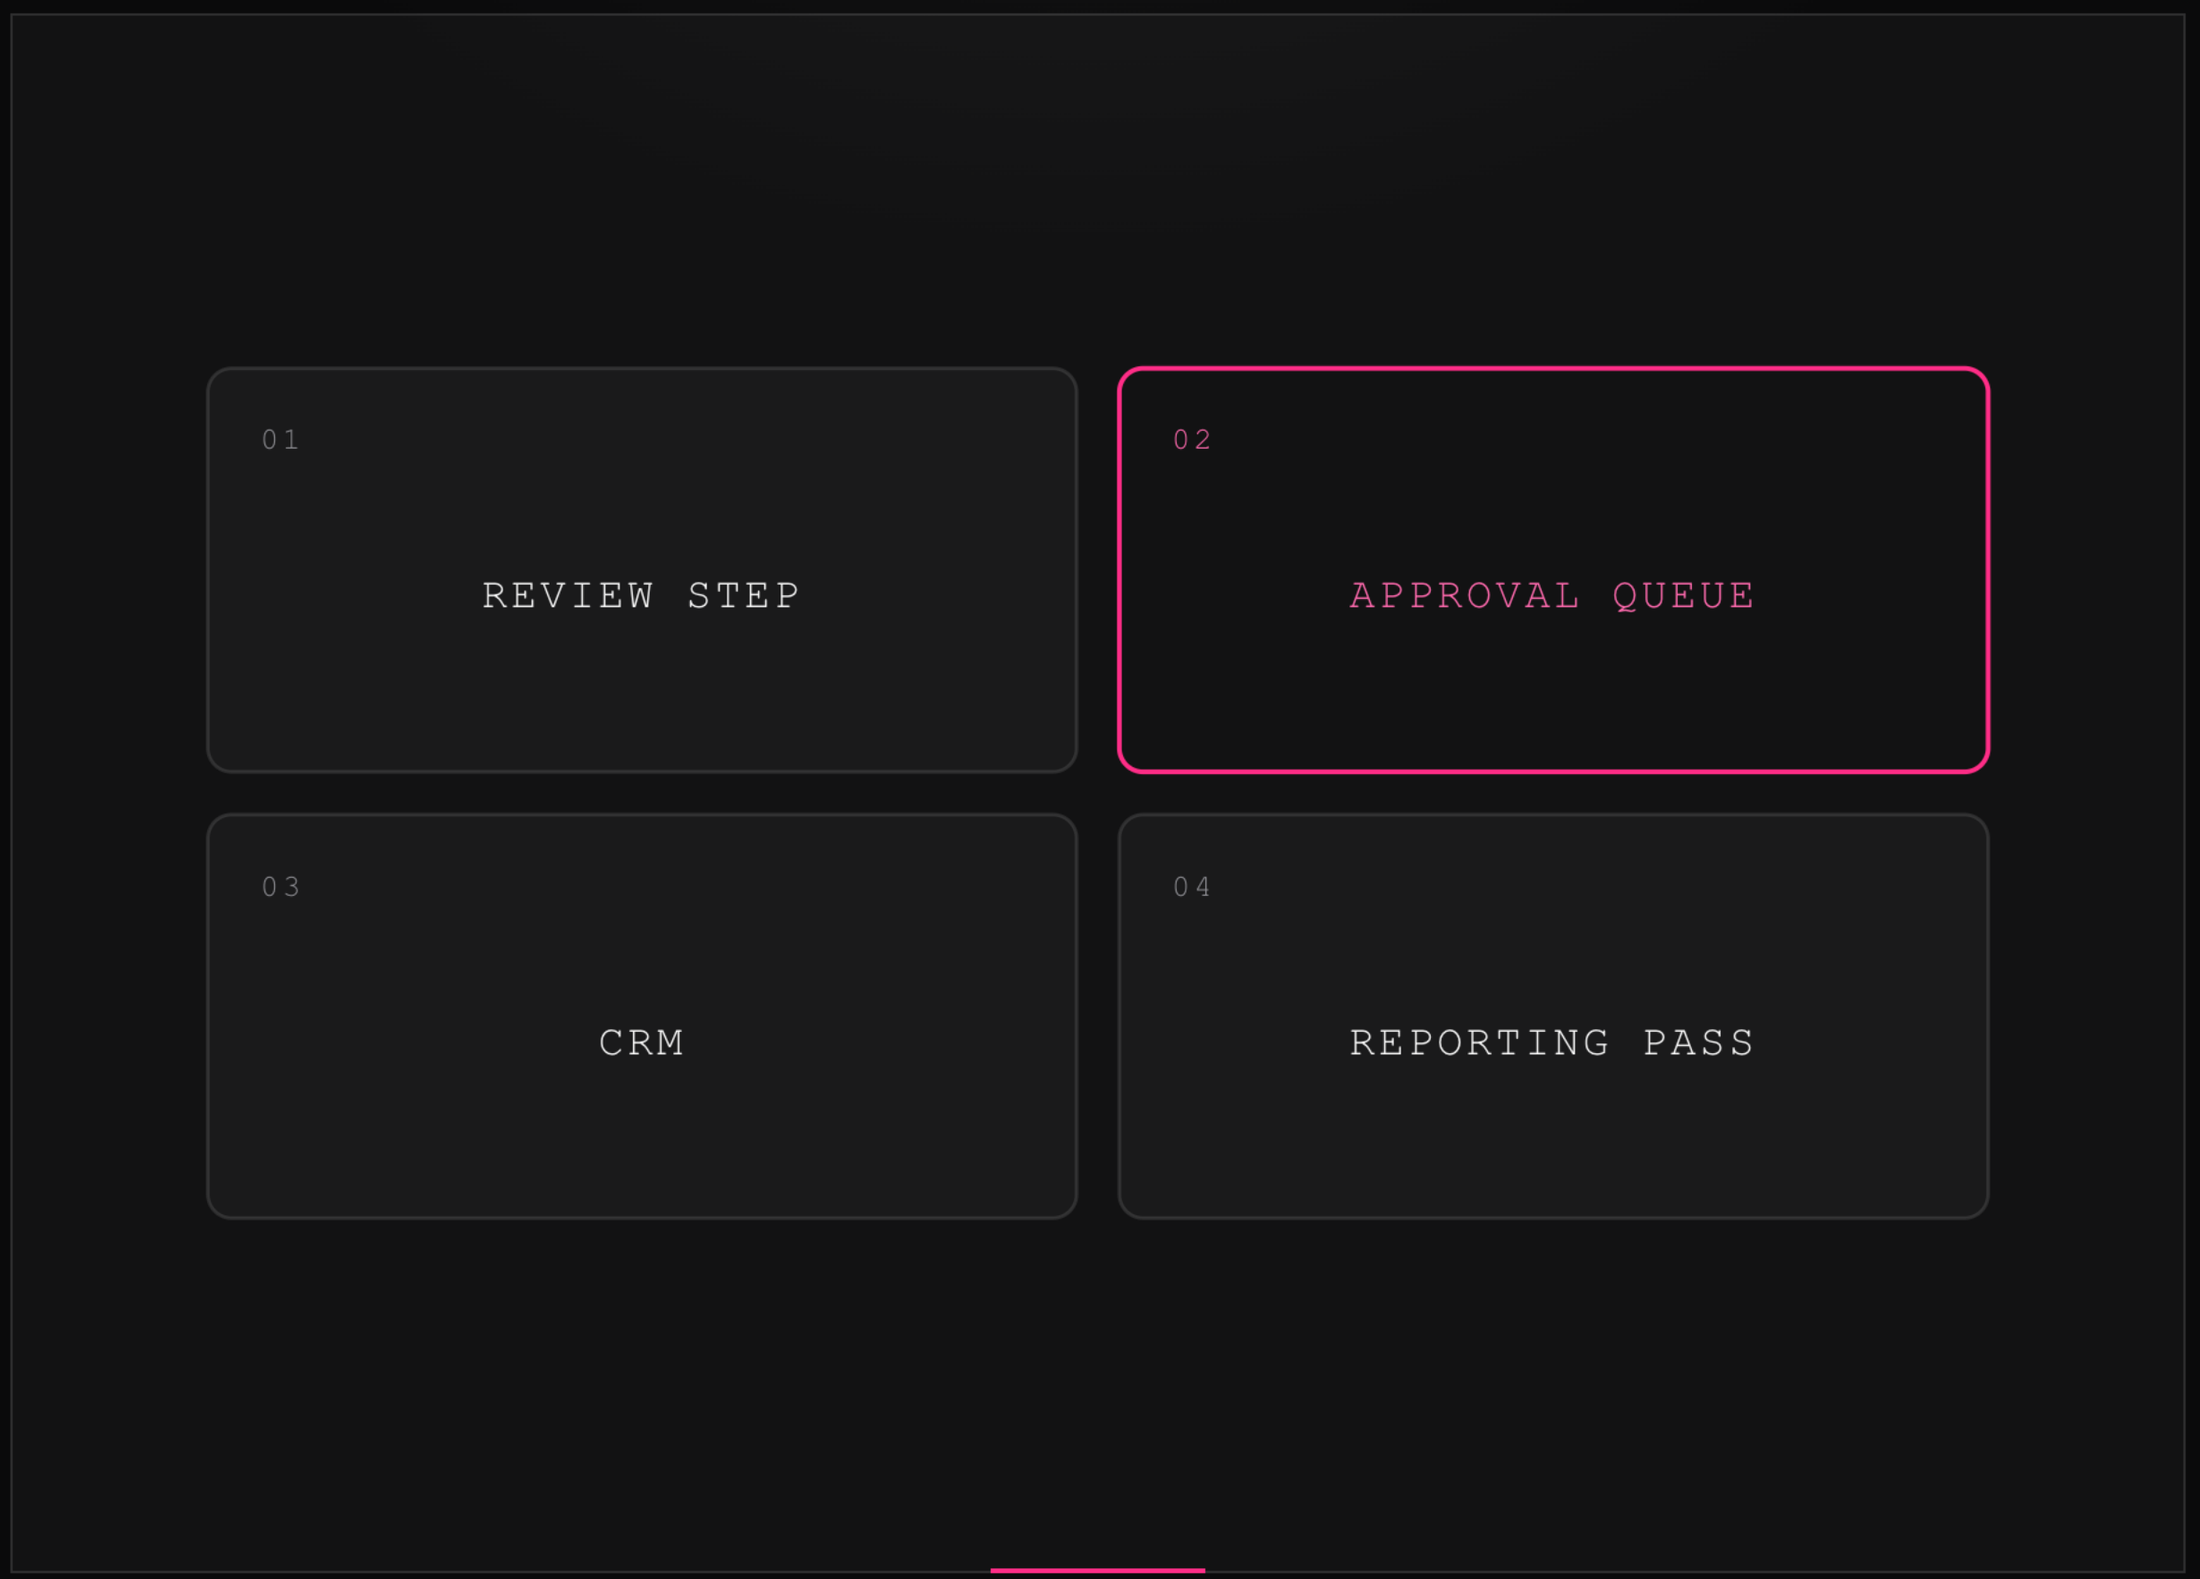

EXHIBIT 05 · FIND YOURS

Your human-paced system is probably not git

My view, not a client case. For a 10 to 200 person company, the first human-paced system agents hit is rarely git.

Find the slow system before buying agents

Expect it to be the real project.
