

I almost shipped infrastructure I didn't understand.

The AI wrote it. I reviewed it. Good thing I stopped.

02 ·

The code was clean. The failure modes were invisible.

Tests passed. Logic was solid. But no alerting, no recovery path, and error handling built on assumptions nobody had verified.

03 ·

One question I couldn't answer.

What happens when this breaks at 3am and the on-call engineer has never seen this code? Silence was the answer. So I didn't ship.

04 ·

The AI writes excellent code. That's table stakes now.

The harder problem: build systems that are debuggable, recoverable, and operable by someone who didn't write them. Under pressure. On a Sunday.

05 ·

Speed is real. Durability is the differentiator.

Teams that own this space in three years aren't the ones who shipped fastest. They're the ones whose systems are still running.
