$ verydian boot --topic "speed billing"
loading context ... done

Both price fast mode at 2x. They meter it differently. _

On Opus 5.5 and on Codex credits, fast mode is 2x. The catch is which meter it runs on.

RUN SESSION

arhem@verydian:~/whose meter$ step 2

2x on Opus 5.5 and Codex credits. Different meters on plans.

Claude Code: on subscription plans fast mode is credits only, outside your rate limits. Codex: Fast mode burns included limits at 2.5x and bills credits at 2x.

STDOUT

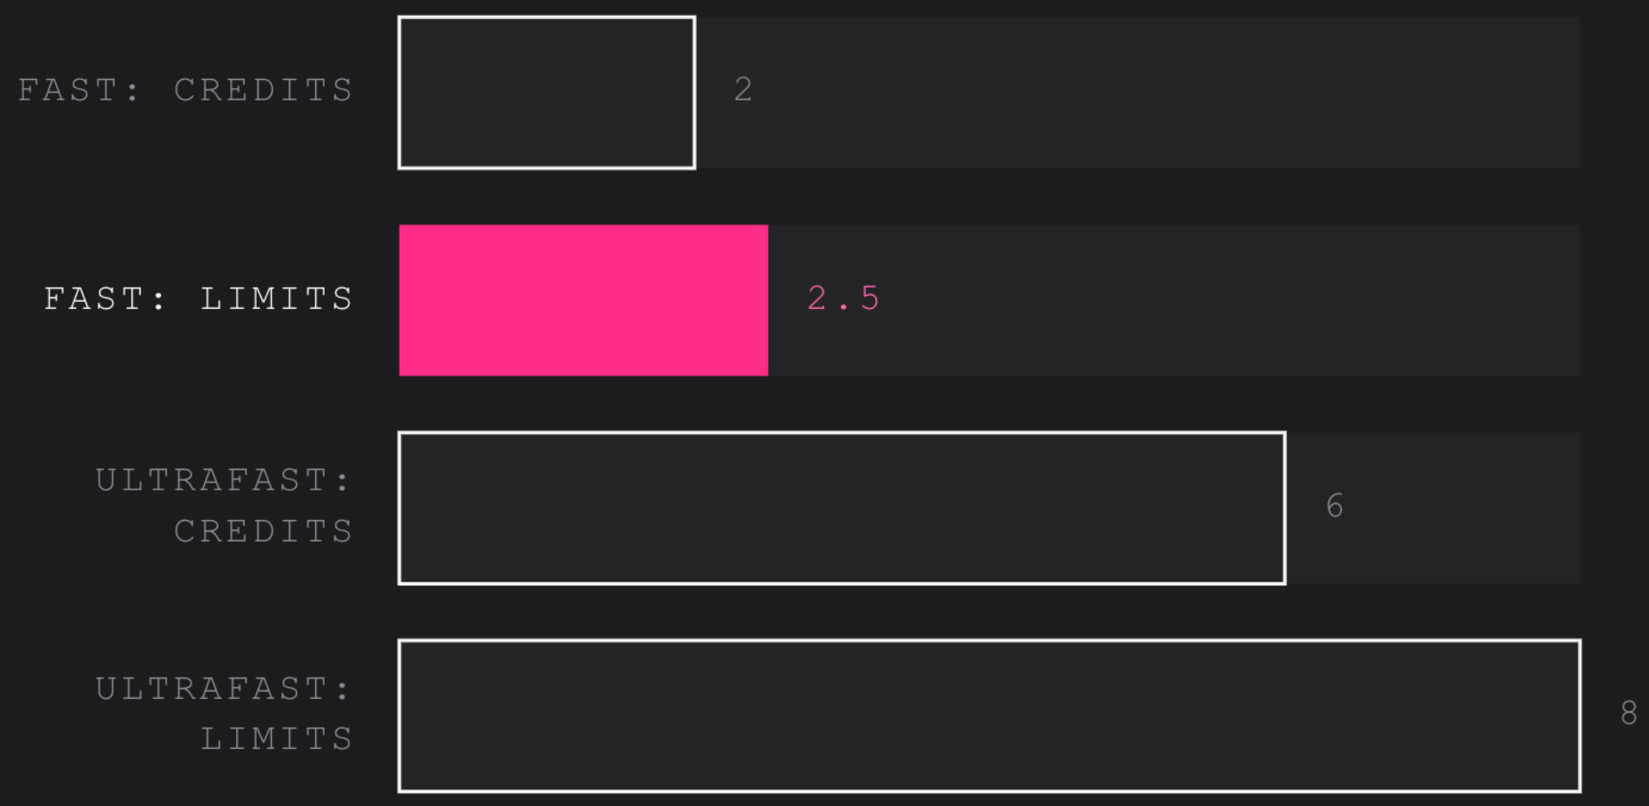

CLAUDE CODE	VS	CODEX
— CREDITS ONLY		• LIMITS AT 2.5X
— 2X ON OPUS 5.5		• CREDITS AT 2X

arhem@verydian:~/codex multipliers$ step 3

Codex bills speed at four different multiples

Multiples of the Standard rate, per OpenAI's docs. Fast: 2x on credits, 2.5x on included limits. Ultrafast: 6x on credits, 8x on included limits.

STDOUT

arhem@verydian:~/the first toggle$ step 4

First toggle: the whole context at the uncached fast price

The docs say the first time you enable fast mode in a conversation, you pay the full fast uncached input price for the entire context. Fast and standard keep separate caches.

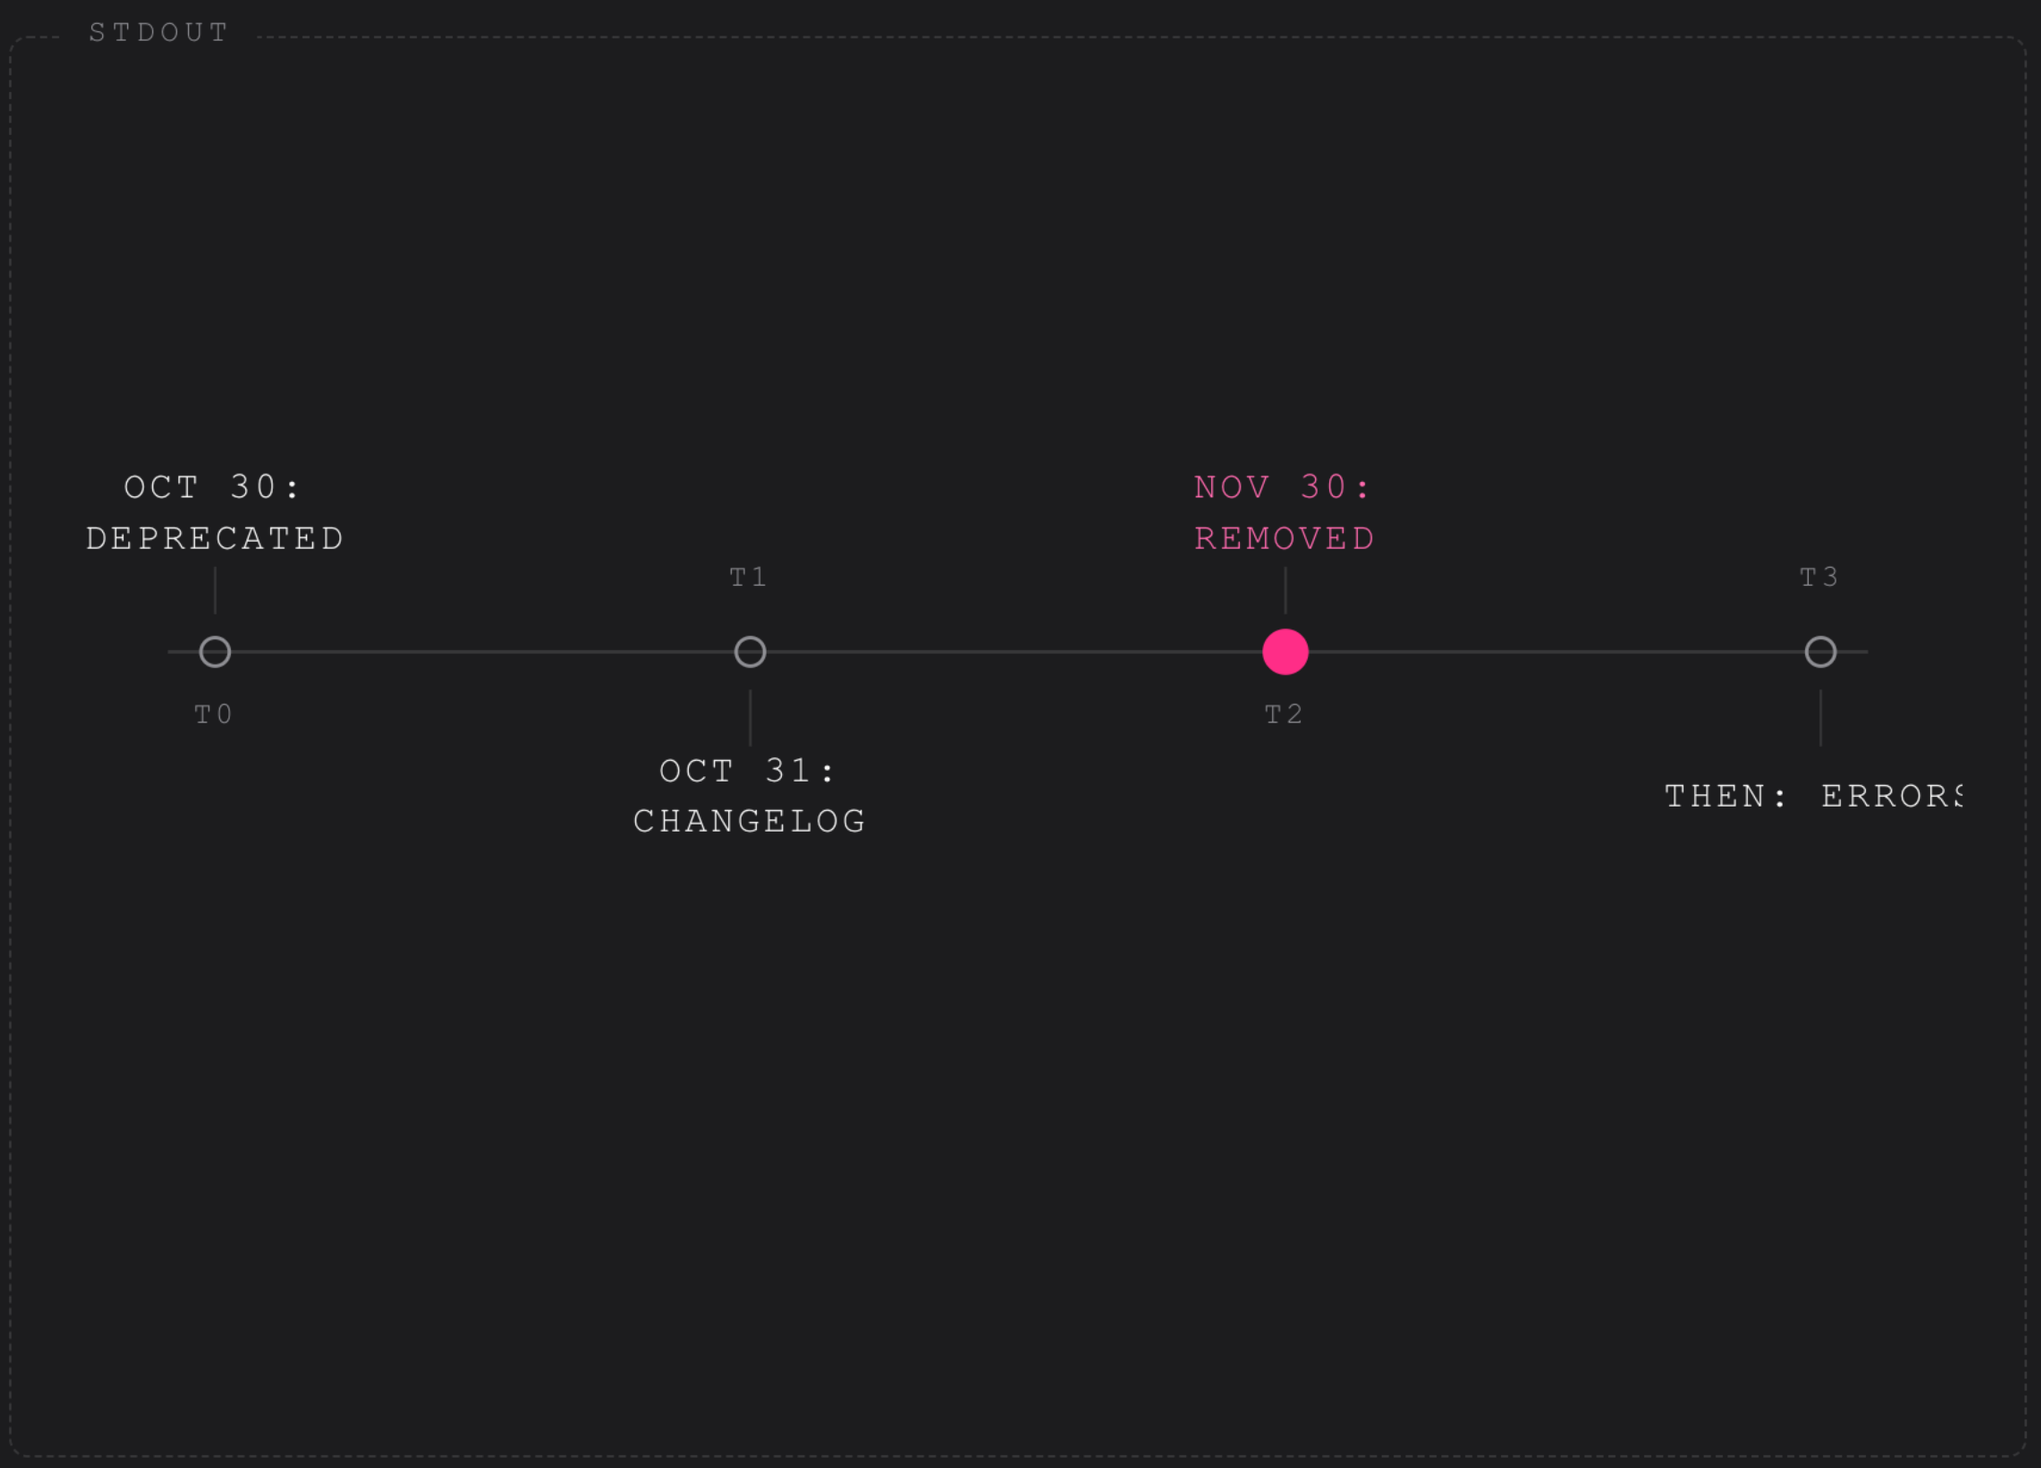

STDOUT

arhem@verydian:~/dated cliff$ step 5

Fast mode on Opus 4.8 ends November 30 with an error

Deprecated October 30, removed November 30, per the Claude Code 2.1.316 changelog dated October 31. After removal, fast requests on Opus 4.8 return an error and do not fall back to standard.

Find the meter before you flip the switch

The Claude Code docs put batch and CI/CD runs under standard mode.
