

Every task fits one of three buckets.

This classification changed how I run Verydian.

Human-only: high-stakes judgment, not high-effort repetition.

If it's human-only because the cost of an autonomous error is catastrophic, that's correct. If it's human-only because nobody built the agent yet, that's different.

AI-only: structured, high-volume, low-variance.

If a human is reviewing every output from something that runs 500 times a day, you've built a monitoring problem. These should run without a human in the loop at all.

Human-supervised AI is your 90-day automation roadmap.

Agent runs the process. Human reviews exceptions and edge cases only. Every task in this bucket is a candidate for moving to AI-only once exception logic is solid.

05 ·

The honest check: why is this task still supervised?

Built that way intentionally? Fine. Still supervised because you haven't trusted the agent to run solo yet? That's the work.
