

SOLO INFRASTRUCTURE

I Run Codex Instead Of A Dev Team

Three sandboxes, one reviewer. That's the whole org chart.

ENTER

```
$  SANDBOX_1:  RUNNING TEST SUITE

$  SANDBOX_2:  DRAFTING DOCS FROM DIFF

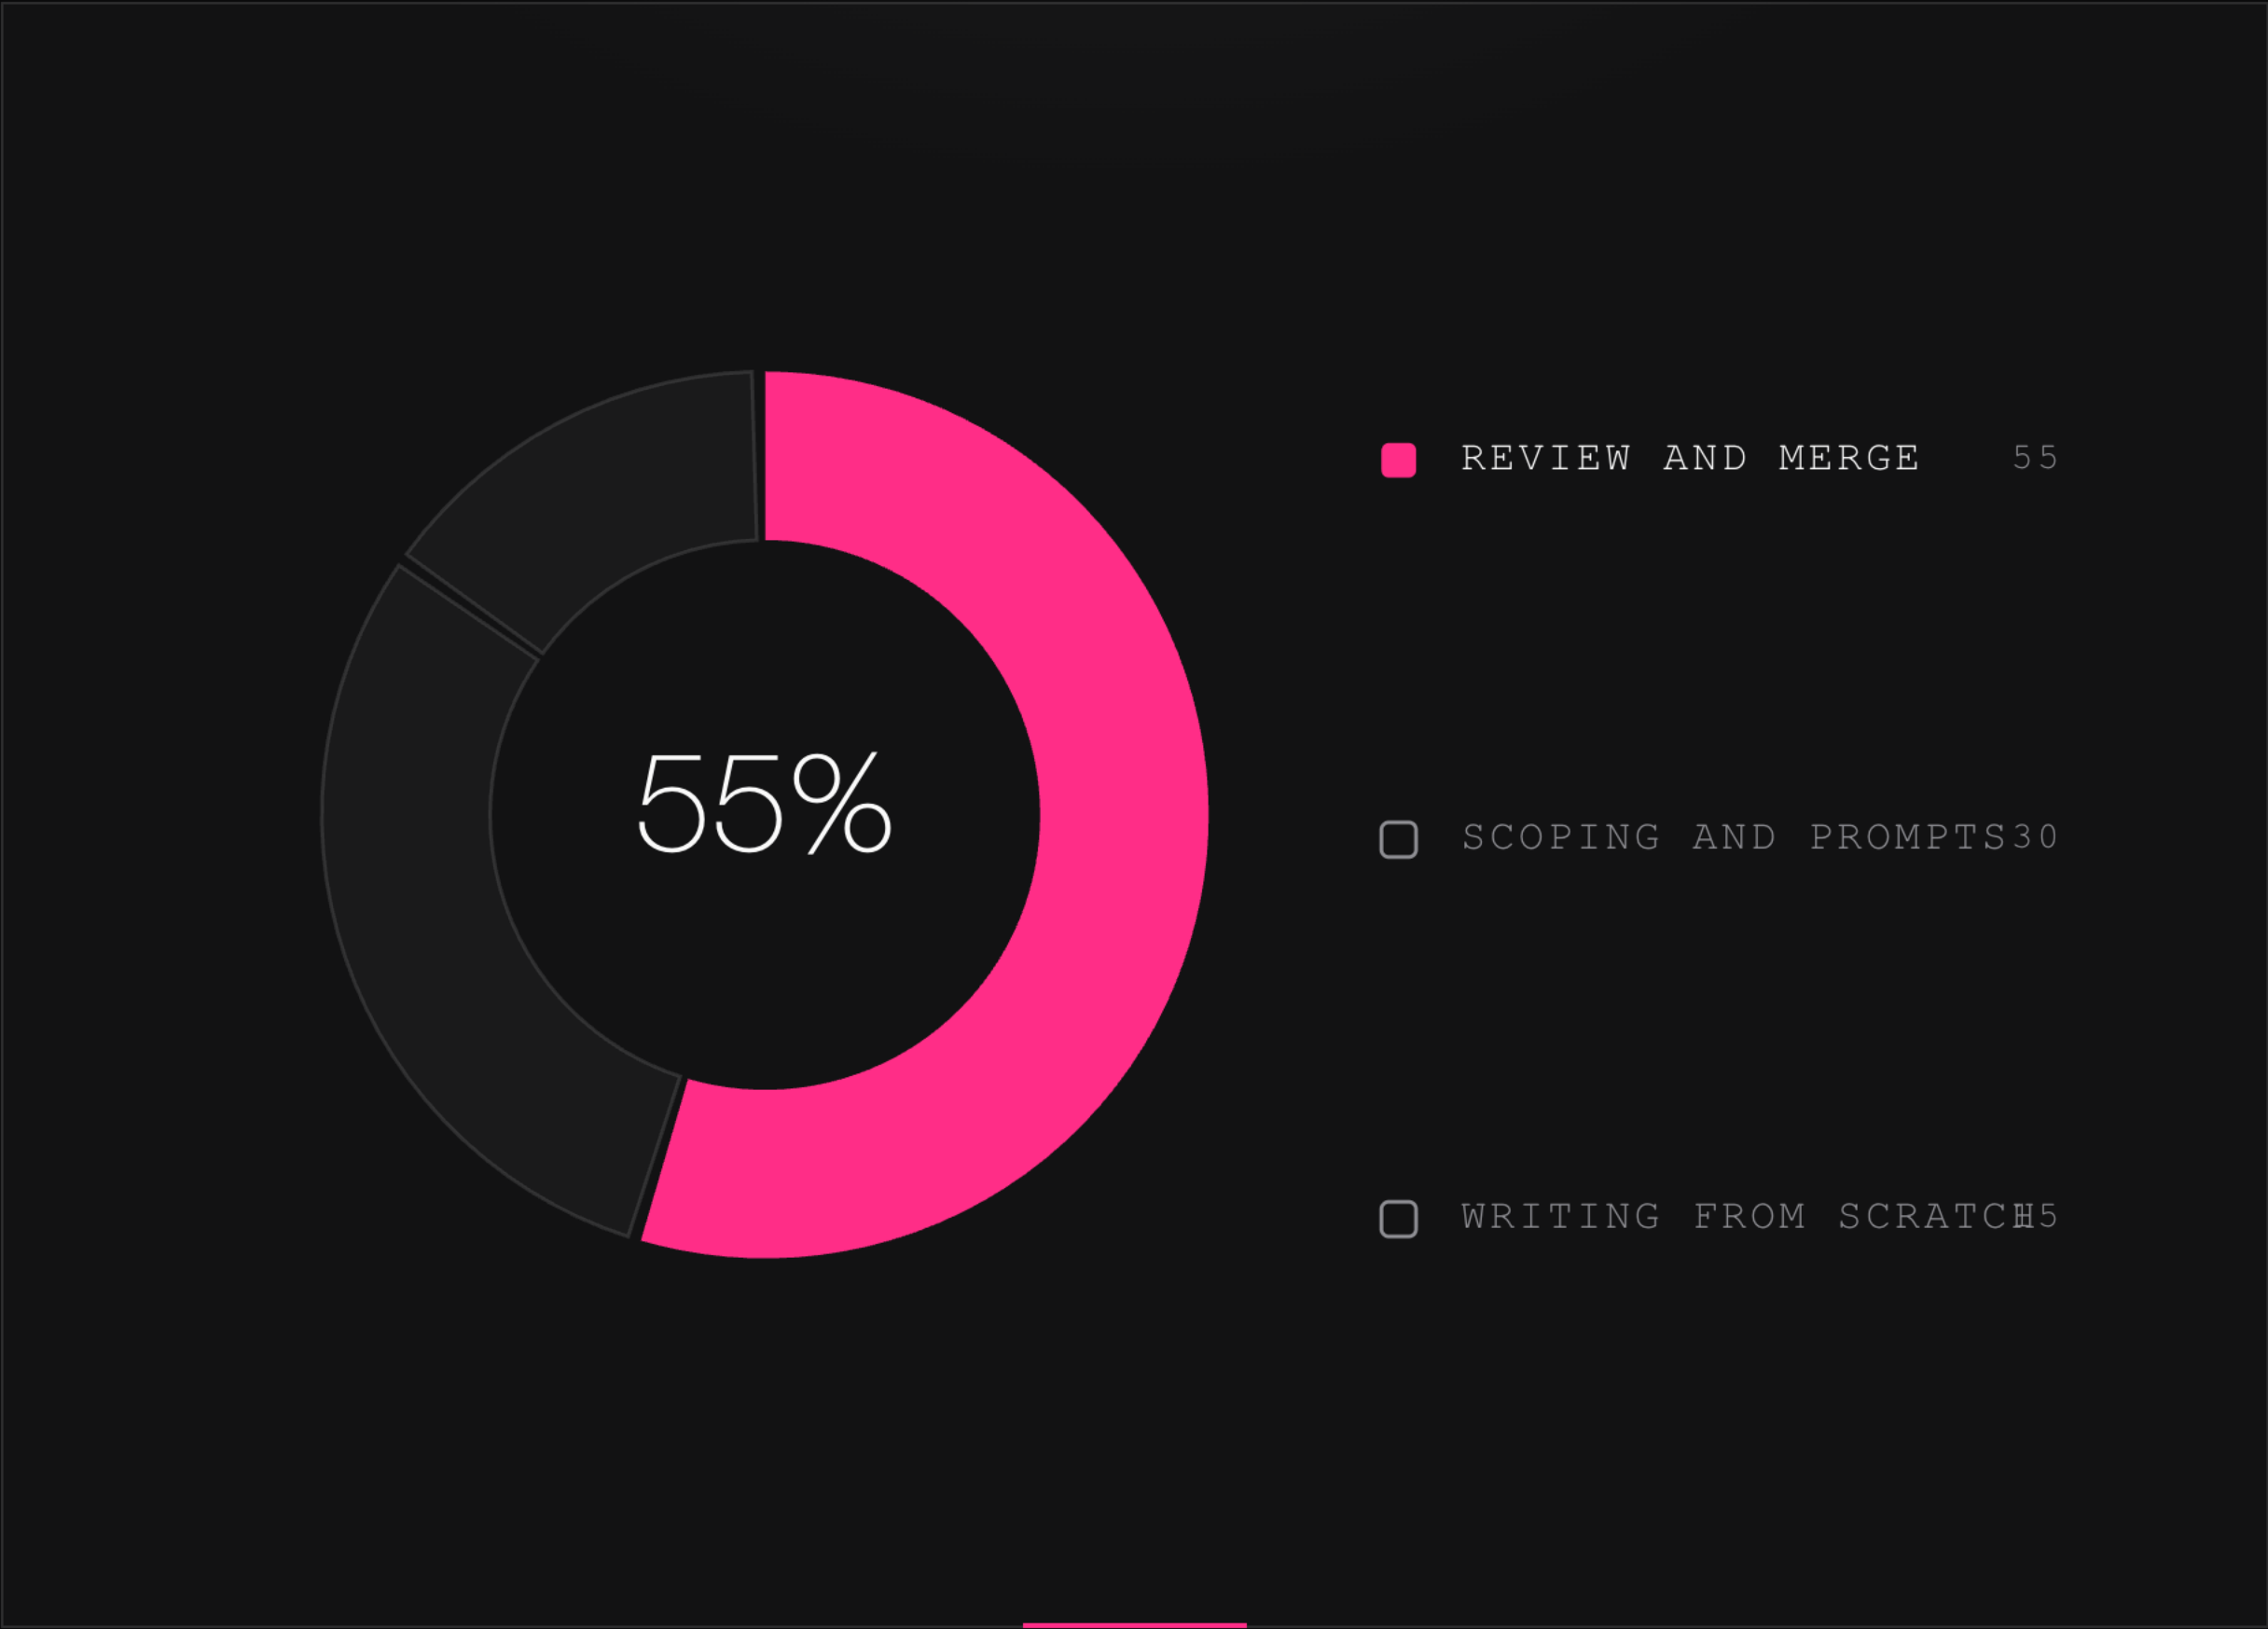

$  SANDBOX_3:  PROPOSING REFACTOR

>  REVIEWER:  MERGING SANDBOX_1
```

● EXHIBIT 02 · THE SETUP

What Three Sandboxes Actually Looks Like

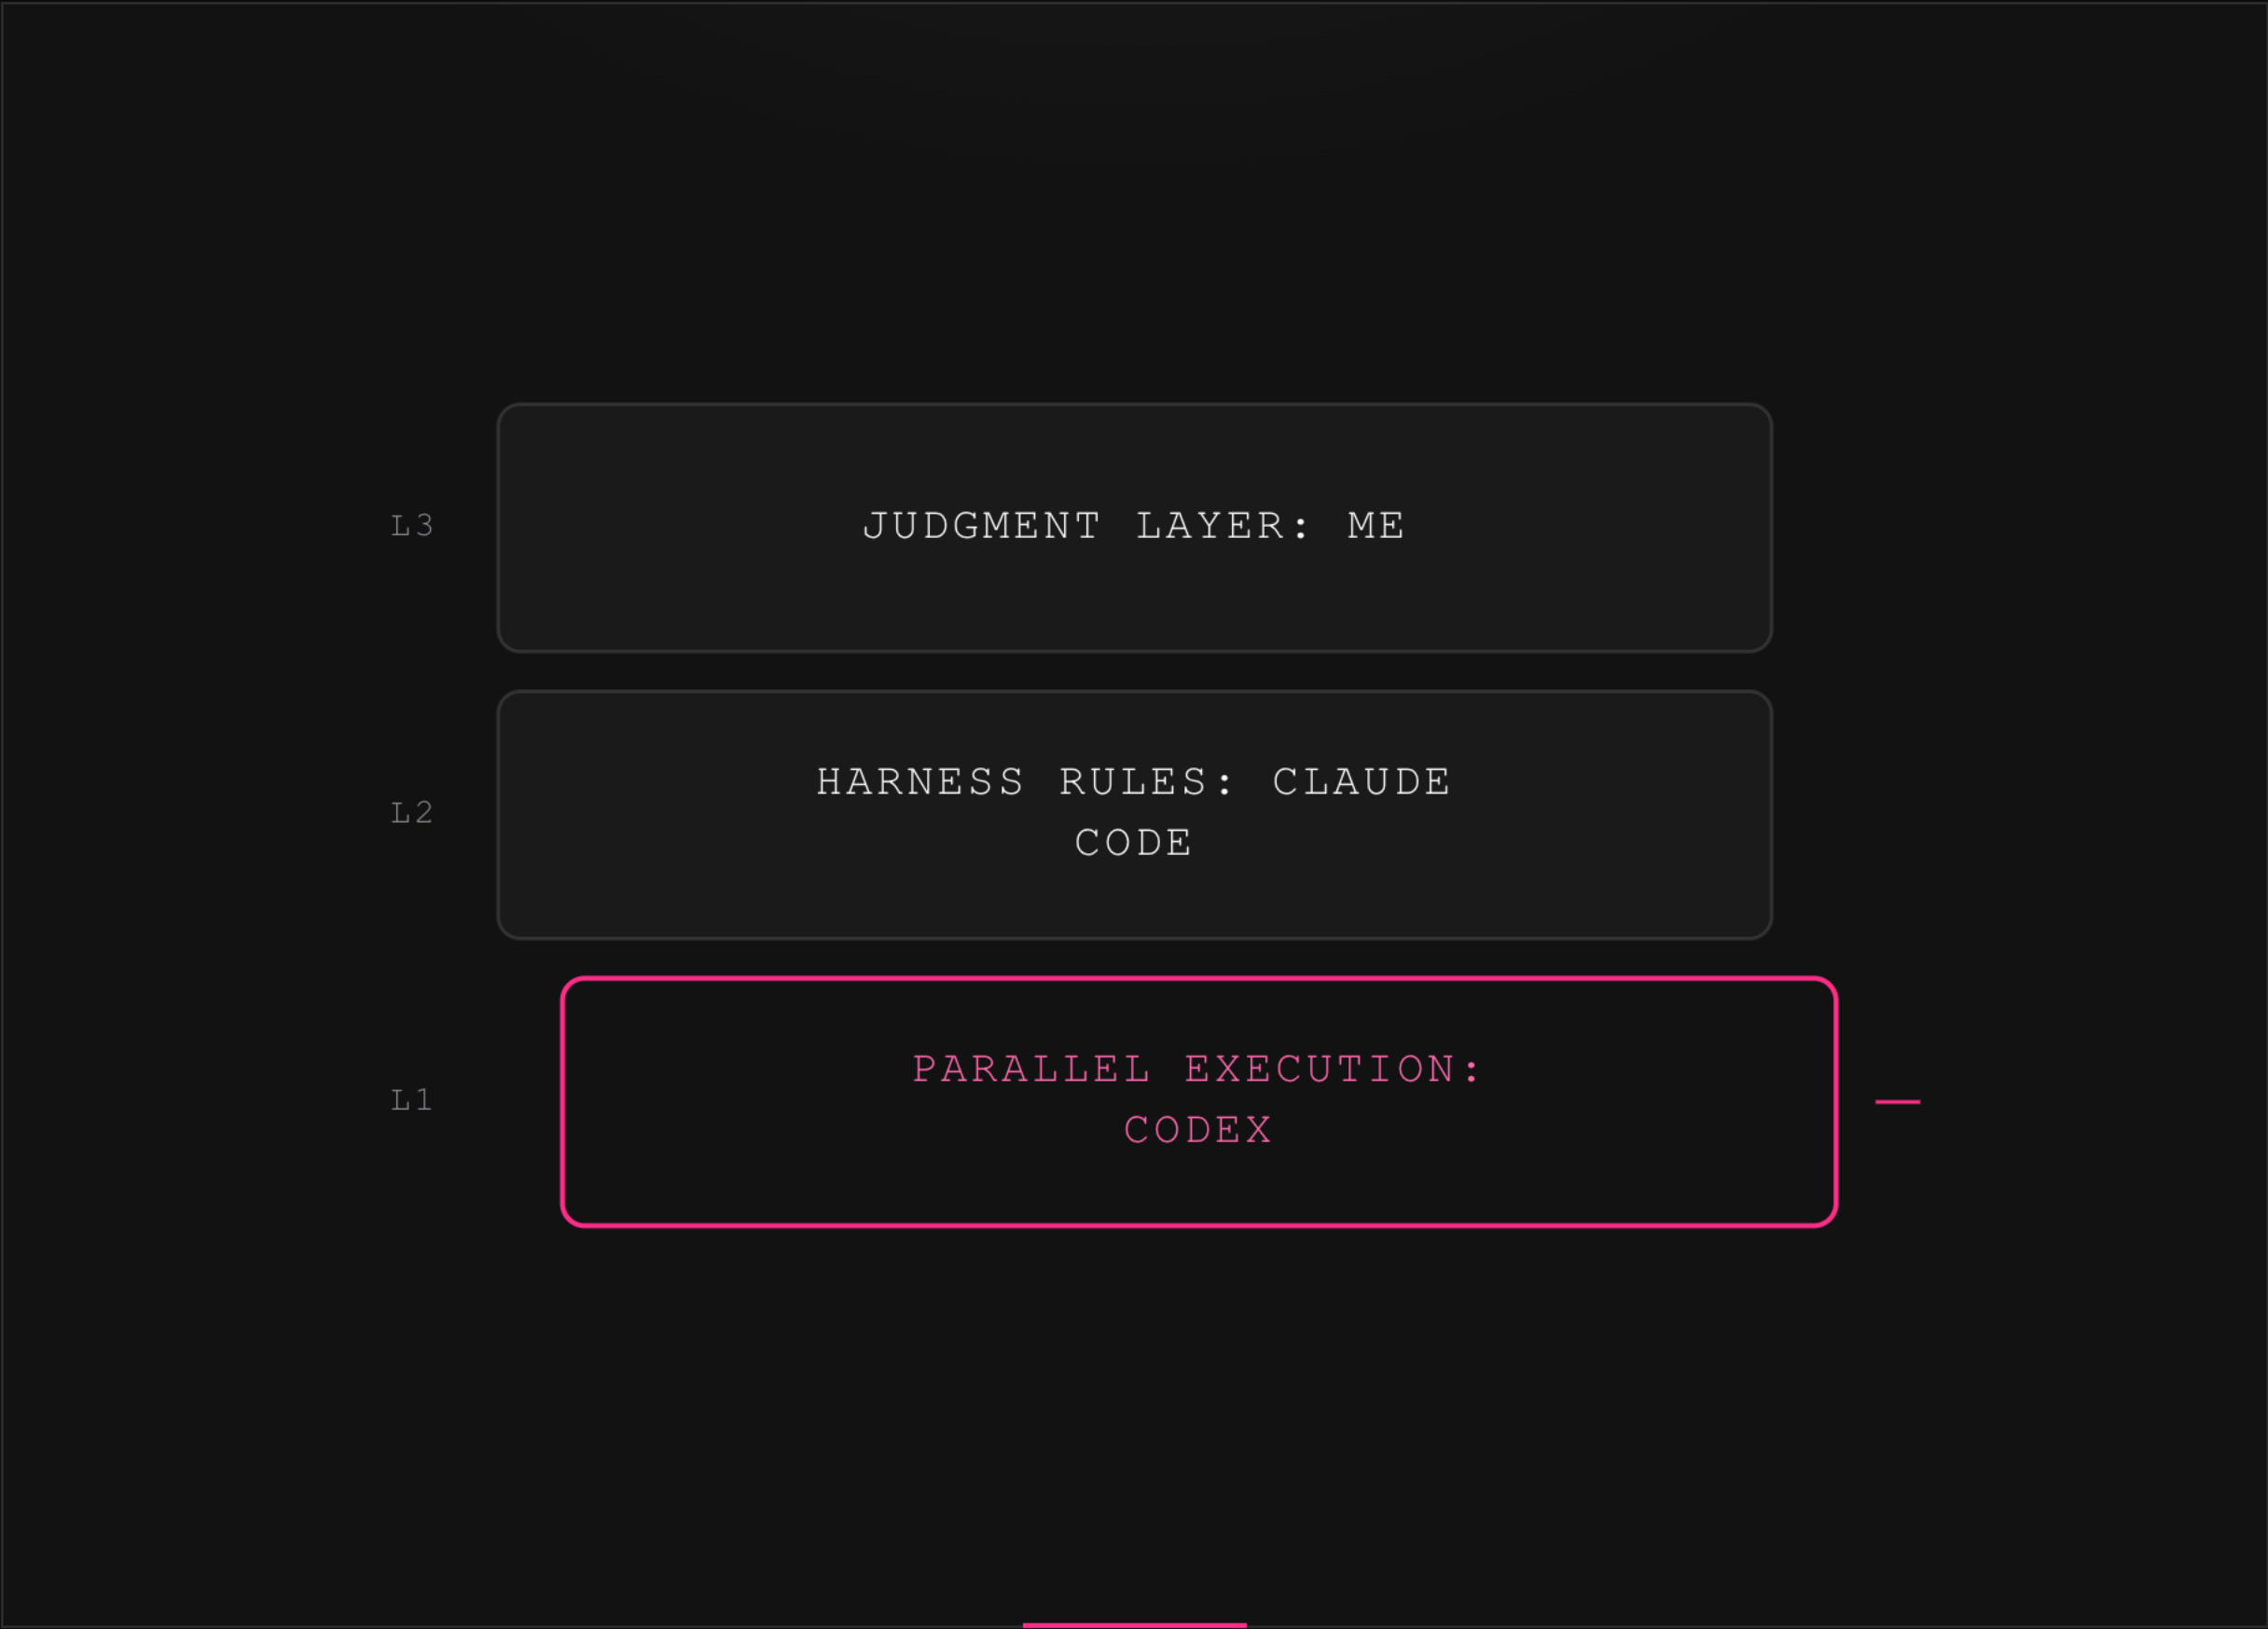

One runs the test suite. One drafts docs off the diff. One proposes a refactor. I read three PRs, not write three PRs.

● EXHIBIT 03 · THE SPLIT

Where My Hours Actually Go Now

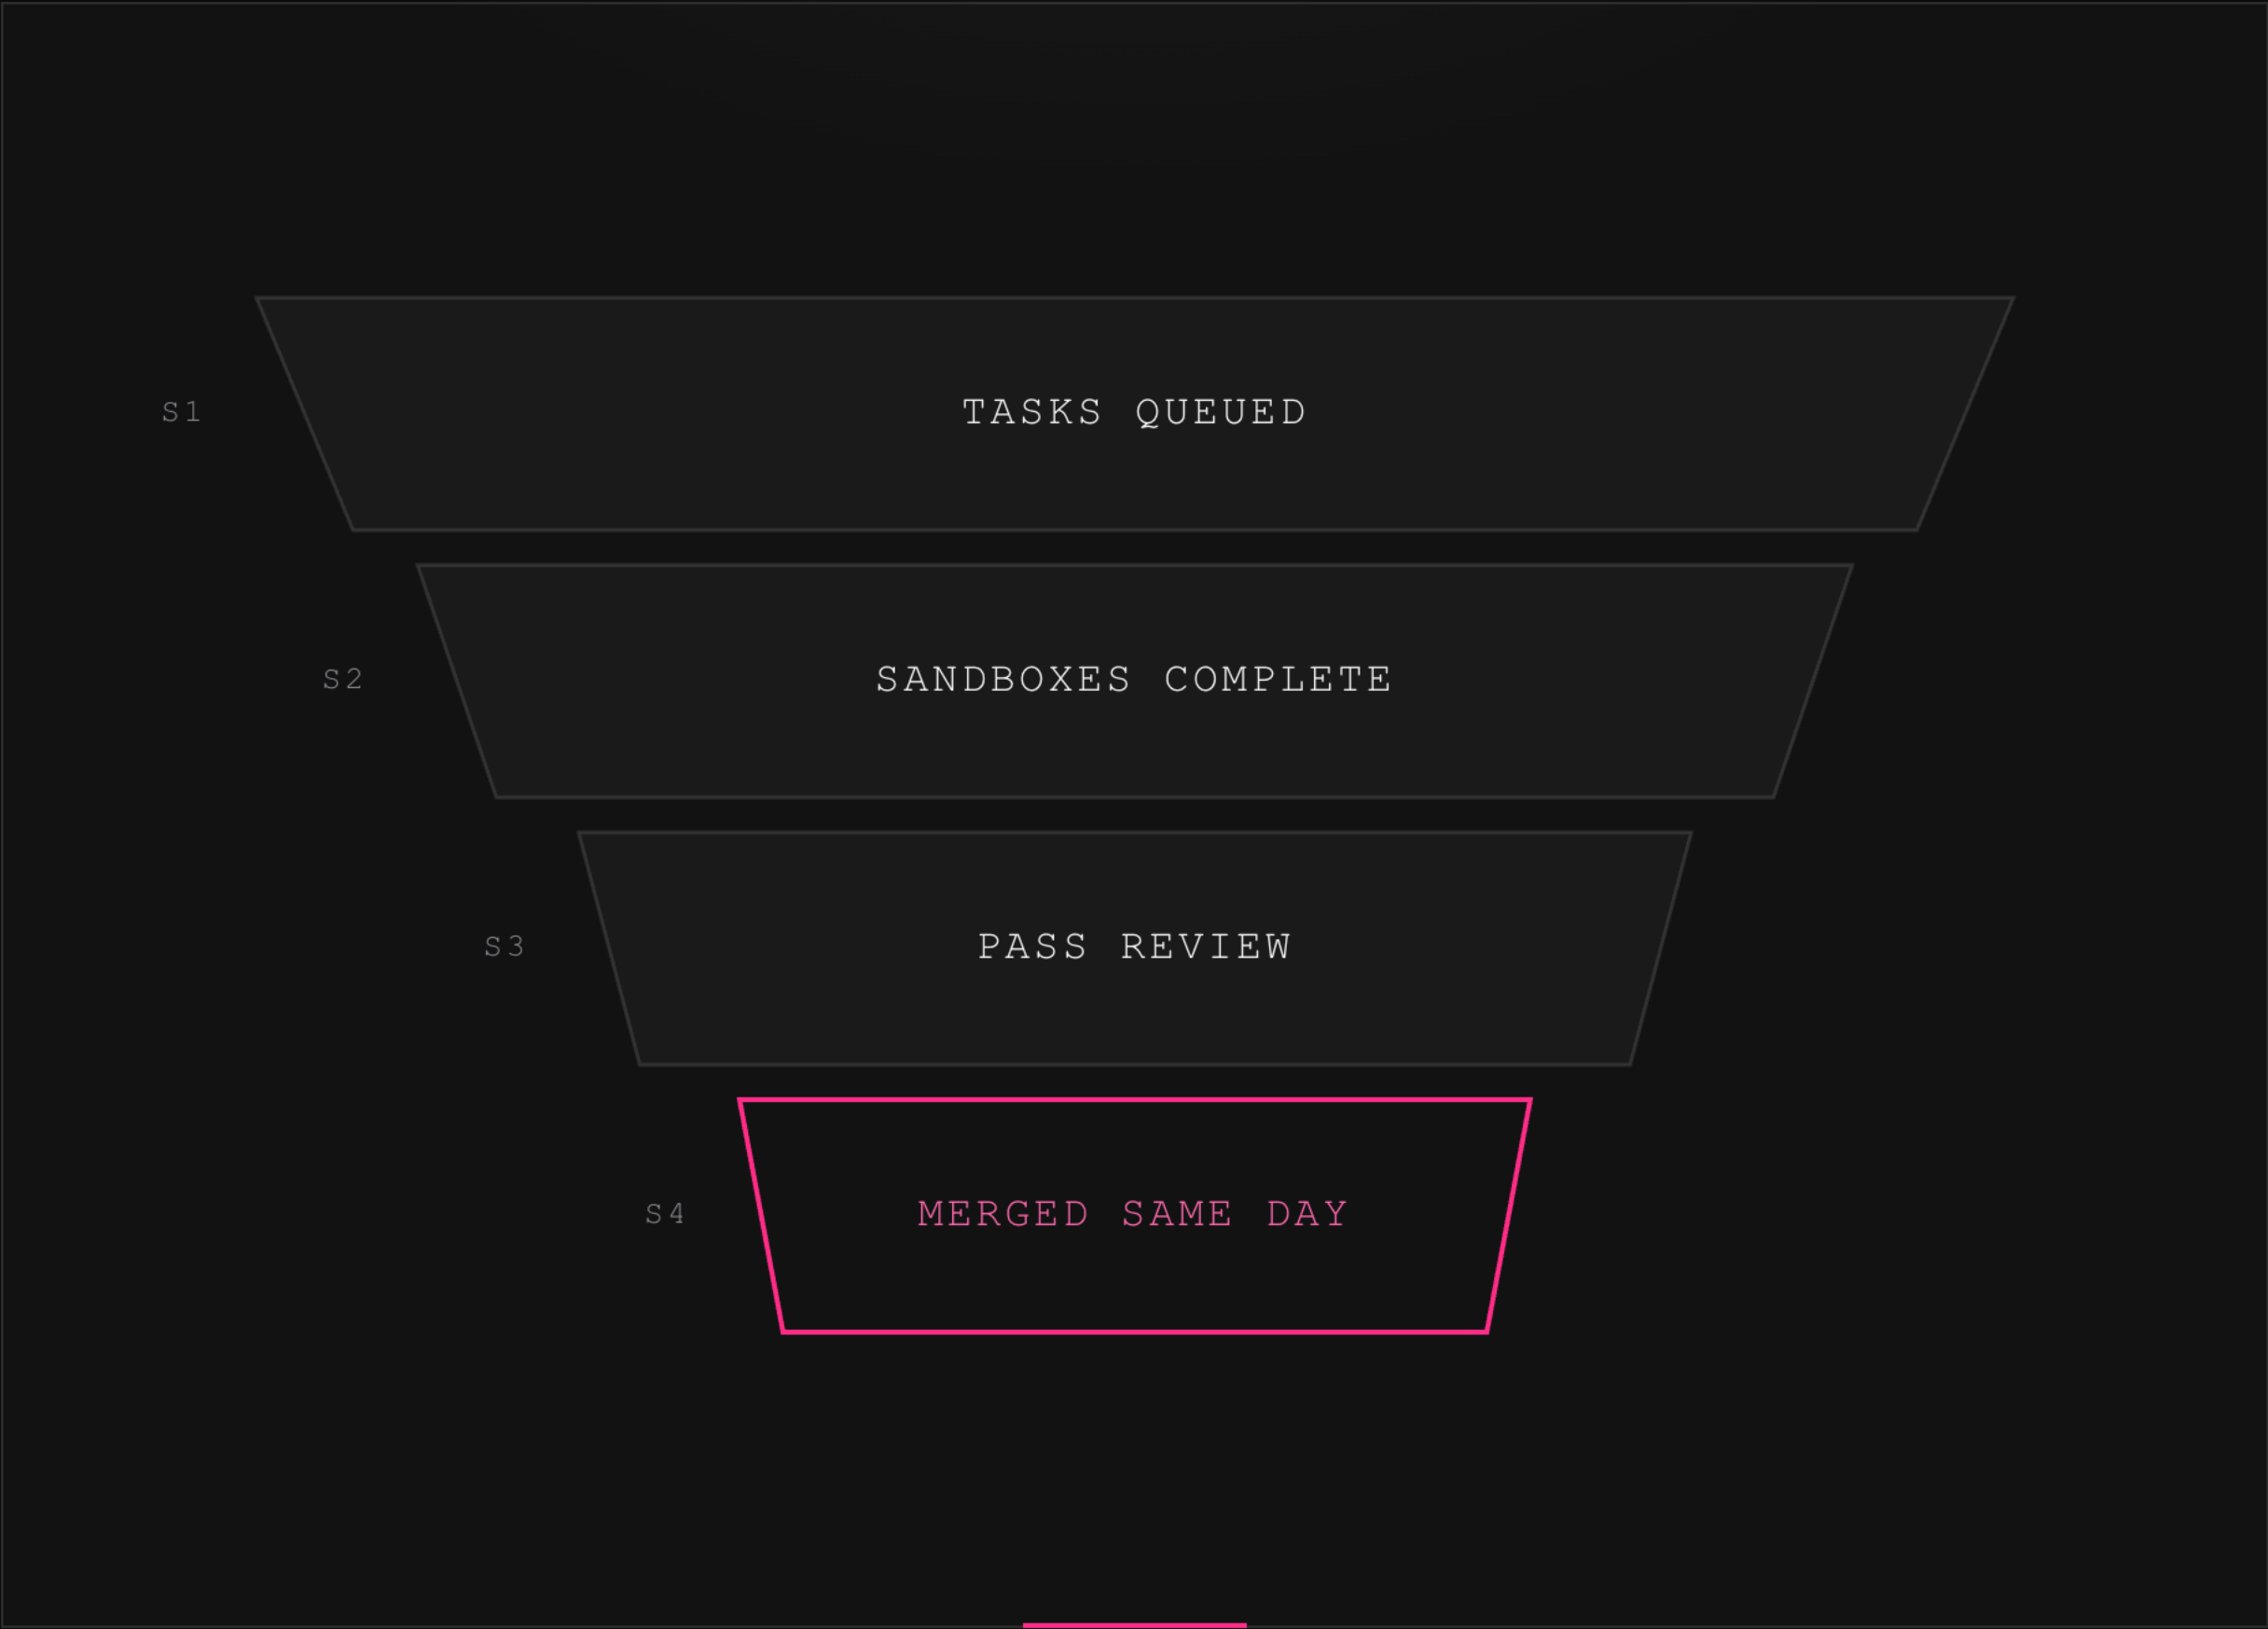

Review and merge take most of the day. Writing code from scratch barely shows up anymore.

● EXHIBIT 04 · THE LAYERS

The Stack That Replaced A Junior Hire

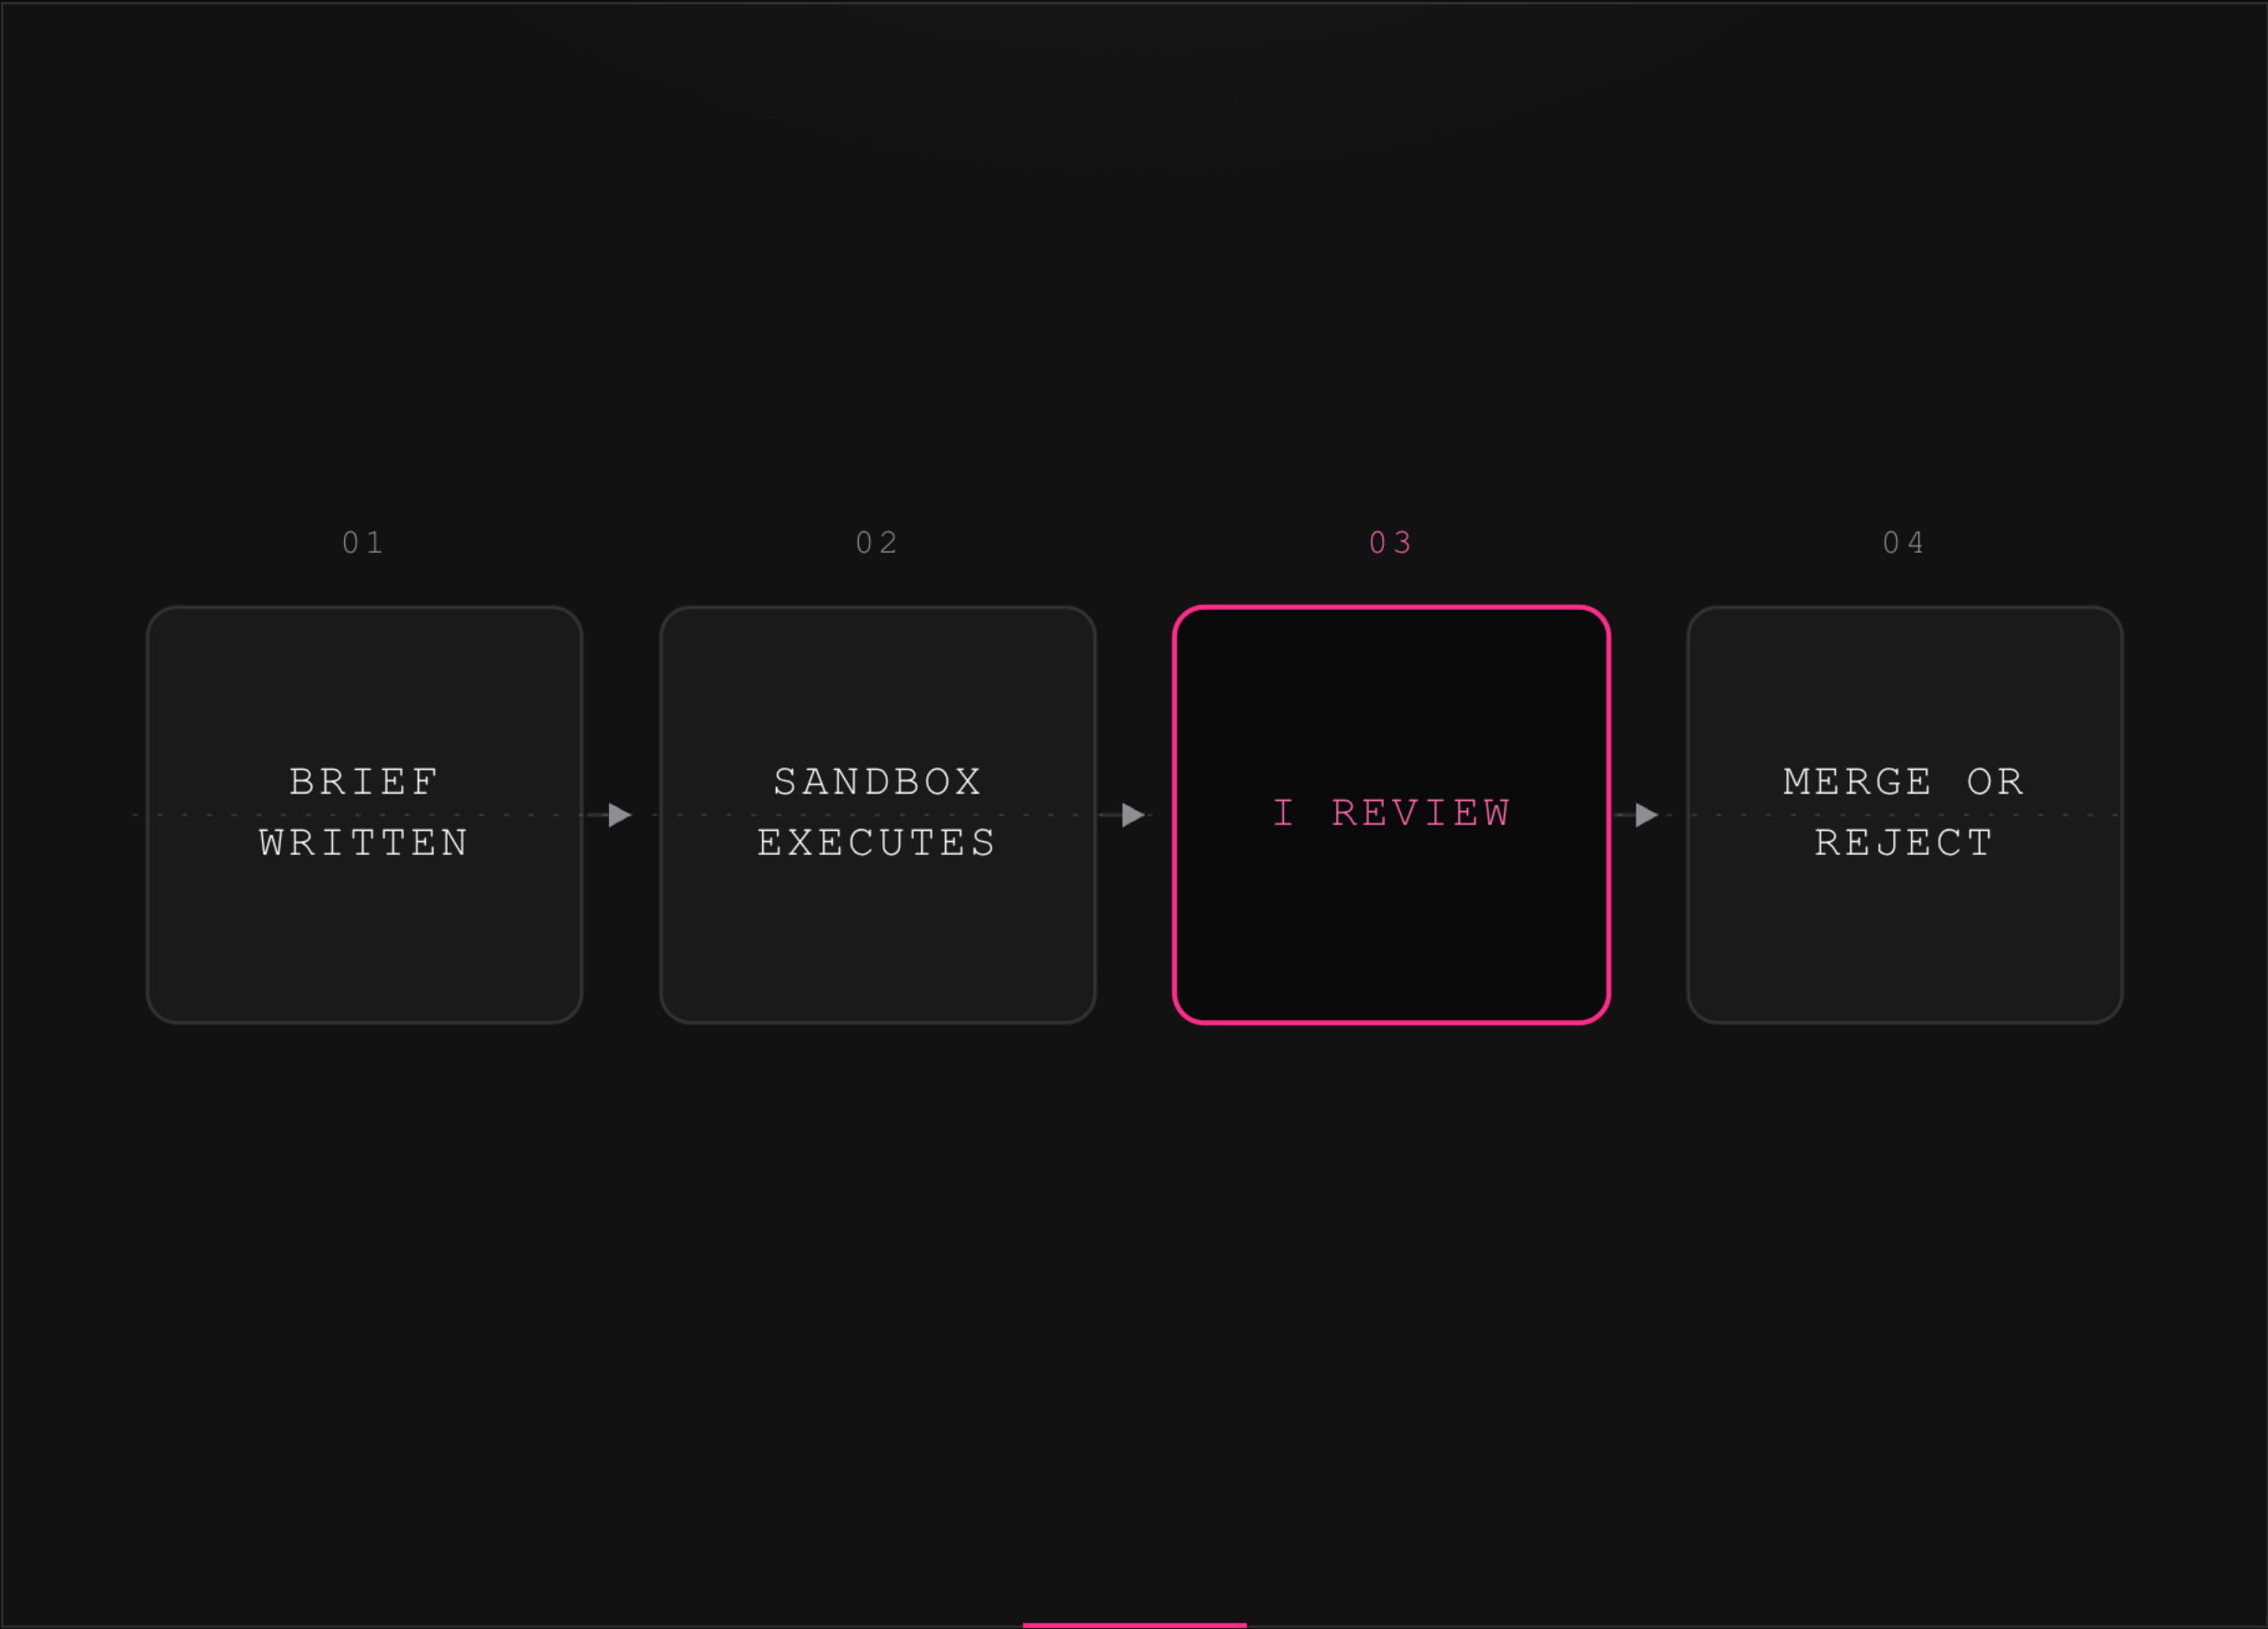

Codex for parallel execution. Claude Code for the harness rules. Me for the calls that need context an agent doesn't have.

● EXHIBIT 05 · THE FILTER

Ten Tasks In, Three Ship Same Day

Most of what the sandboxes produce gets rejected or reworked. That filtering is the actual job now.

● EXHIBIT 06 · NO SHORTCUTS

How A Task Moves End To End

I write the brief. The sandbox runs it. I review, reject, or merge. Nothing ships without that last step.

This Is What Lean Actually Means

Not fewer features. Fewer people between the idea and the ship.
