

Codex goes on-premises. Enterprise AI just shifted.

The barrier was never capability. It was governance infrastructure.

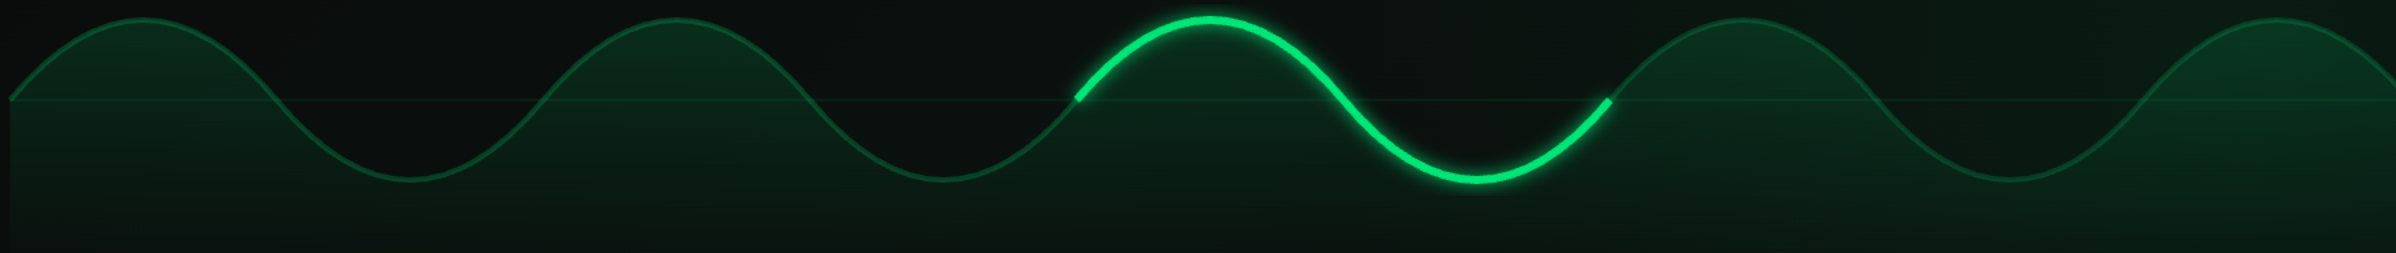

Dell AI Factory + Codex: the first real enterprise deployment model.

May 18, 2026. The first frontier coding agent with a path into regulated environments. On-premises and hybrid via Dell AI Factory.

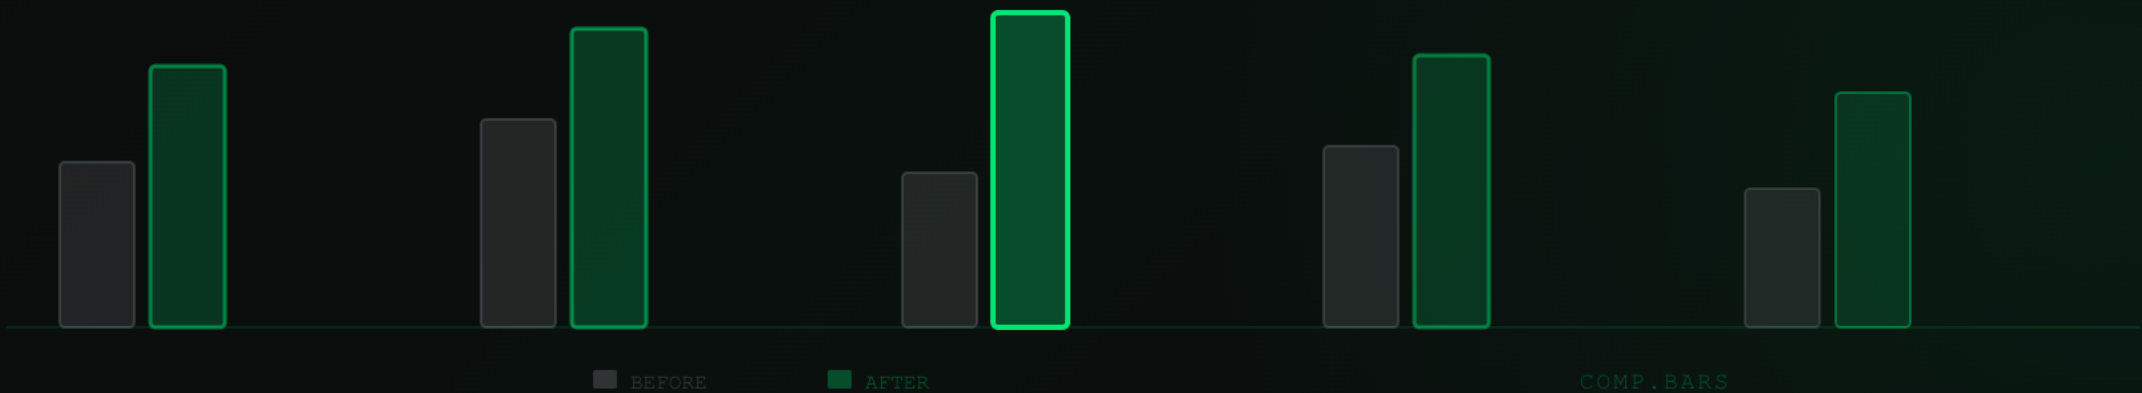

The real blocker was data residency, not capability.

Hospitals, defense contractors, financial firms. They couldn't route sensitive data through cloud APIs. That's a legal constraint, not risk aversion. Now there's architecture for it.

Regulated industries now have a real path: HIPAA, ITAR, FINRA, GDPR.

The compliance blockers were structural. On-premises deployment meets them directly. The conversation moves from 'can we?' to 'what's our deployment model?'

Tooling mature enough to meet enterprise terms, not ask enterprises to bend.

That's the signal. Not that enterprises loosened their requirements. That the tooling finally met them. Two different things with very different implications.

EXEC.BRIEF / AI INFRASTRUCTURE

Follow me — I build in public

Follow for infrastructure signals that actually matter.
