

OPERATIONAL GRAVITY

One report. Fifteen days. \$2,200.

A Fortune 500 team cut it to 35 minutes and \$9 by moving it off someone's calendar and onto an agent.

SWIPE

BEFORE

02 / 06

Fifteen days to produce one number

One analyst pulled data by hand, built the deck, and walked it through review. Total cost: \$2,200 before anyone read a page.

AFTER

03 / 06

Same report, different infrastructure

The agent pulls the same data, runs the same checks, and formats the same deck. It just doesn't stop to sleep, ask for a status update, or wait on a calendar hold.

BEFORE

- 15 DAYS
- \$2,200
- ONE ANALYST

VS

AFTER

- 35 MINUTES
- \$9
- ONE WORKFLOW

What the workflow actually does

Pull the source data, clean it, run the checks a human used to eyeball, format the output, and flag anything that looks off before it ships.

This isn't just a reporting problem

The same drag shows up in follow-ups, data entry, and reconciliation.
Anywhere a human bridges two systems by hand, the gravity is the same.

I map this gravity before I build

Send me the process that eats your week and I'll tell you what it
actually costs.
