AGENT ARCHITECTURE

Google pitched one universal agent. Underneath, a roster.

Gemini's front door is a single agent. Per Google's own post, it can create job-specific sub-agents, each with its own identity.

SWIPE

THE FOUR QUESTIONS

02/07

Google's governance is four questions

Who is the agent? What is it allowed to do? What did it do? What should it never touch? Identity, policy and observability answer the first three. The fourth is Agent Gateway.

01

WHO IS THE AGENT?

02

WHAT MAY IT DO?

03

WHAT DID IT DO?

04

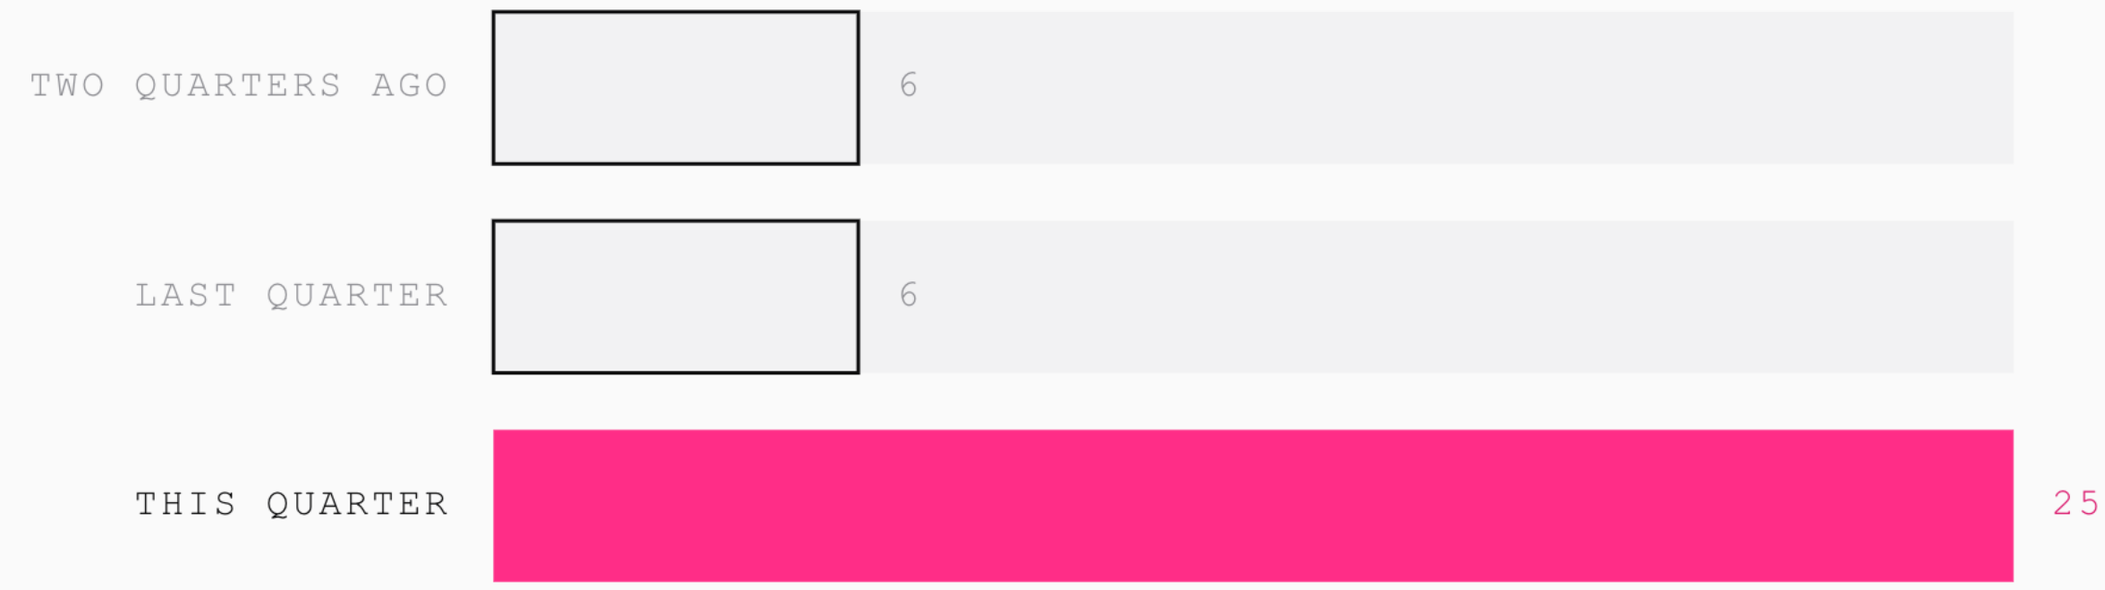

WHAT'S NEVER TOUCHED?

BIG-COMPANY CONTEXT

03/07

Multi-agent work went from 6% to 25% in a quarter

KPMG's Q3 survey of 314 U.S. leaders at $1B+ companies: 25% are developing or implementing multi-agent systems, up from 6% in each of the previous two quarters.

PITCH VS DESIGN

04/07

The pitch is one agent. The design is a roster.

Google calls the Gemini agent a single, universal agent. In the same post it can dynamically create sub-agents, each temporary, job-specific and carrying its own identity.

THE PITCH

- ONE UNIVERSAL AGENT
- SINGLE FRONT DOOR

VS

THE DESIGN

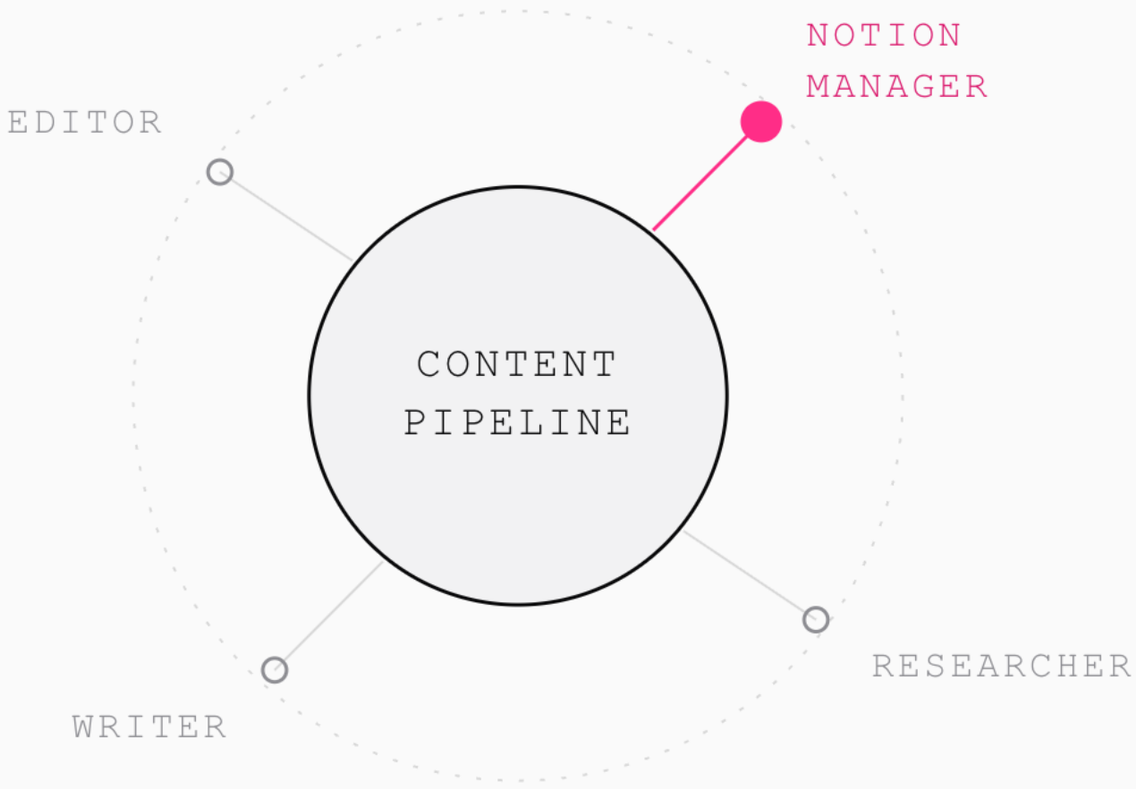

- ROSTER OF SUB-AGENTS
- IDENTITY PER SUB-AGENT

MY VERSION

05/07

My pipeline already runs narrow workers

Researcher, writer, editor and notion-manager each have their own brief and a single job. As of July, Agentic OS routes destructive bash through a guardrails hook to an approval card.

THE COPY LIST

06/07

What a 50-person team can copy today

My view, not Google's: one scoped agent, its own log, a gate for what it must never touch. No platform required. My gap: historical Agentic OS sessions aren't account-tagged.

Start with one scoped agent

Give it its own log and one approval gate before you add a second.

SCOPE ONE AGENT
