

3% error in
demo. 50% error
in production.

Why AI systems fail after sign-off. and how to prevent it

DENSITY.MAP

02 ·

POC data is clean.
Production data isn't.

Inconsistent formatting, duplicates, missing fields.
The model assumed clean inputs. Production
doesn't provide them.

PIPE.STATE

03 ·

LLM failures don't look like crashes.

They look like plausible wrongness. The wrong company name. A near-correct classification. It ships to customers.

04 ·

Software bugs fail loudly. LLM failures fail quietly.

At scale, over weeks, in ways that take time to surface. By then the damage is compounded.

MATRIX.PATH

05 ·

What production-grade actually requires:

Input validation, output schemas, retry logic, confidence scoring, output quality monitoring. None of it appears in a demo.

06 ·

The POC never tested any of this.

Not glamorous. Not visible in a slideshow. All of it
is what separates reliable from eroding.

EXEC.BRIEF / AI INFRASTRUCTURE

FOLLOW ME —
I BUILD IN PUBLIC

Build for production from the start.

I build this in public. Follow along for real frameworks,
honest lessons, and how Verydian actually gets built —
week by week.
