01

My CRM showed 1,000 leads. The database held 2,352.

In July, a 1,000-row cap hid up to 1,352 leads from my dashboard. Nothing threw an error.

SWIPE

NO. 02 · THE GAP

The database held 2,352. The request returned 1,000.

After the July 12 imports, the database held 2,352 leads across 9 lists. The dashboard KPIs, task queues and All Leads view were missing up to 1,352.

NO. 03 · HOW IT HIDES

A capped list looks exactly like a full one

The bootstrap endpoint fetched leads in one PostgREST request. Supabase's docs say projects return a maximum of 1,000 rows by default. The response was a valid list. Just a short one.

NO. 04 · DEAD PARAMS

The reports endpoint asked for up to 10,000 and got 1,000

That evening the same cap turned up in the reports summary. Those limit params did nothing, so the Reports KPIs came from at most 1,000 leads.

```
$  CALL_LOGS LIMIT=5000

$  ACTIVITIES LIMIT=10000

$  LEADS LIMIT=10000

>  EACH CAME BACK AT 1,000 ROWS
```

NO. 05 · THE FIXES

Two fixes in one day, one cause

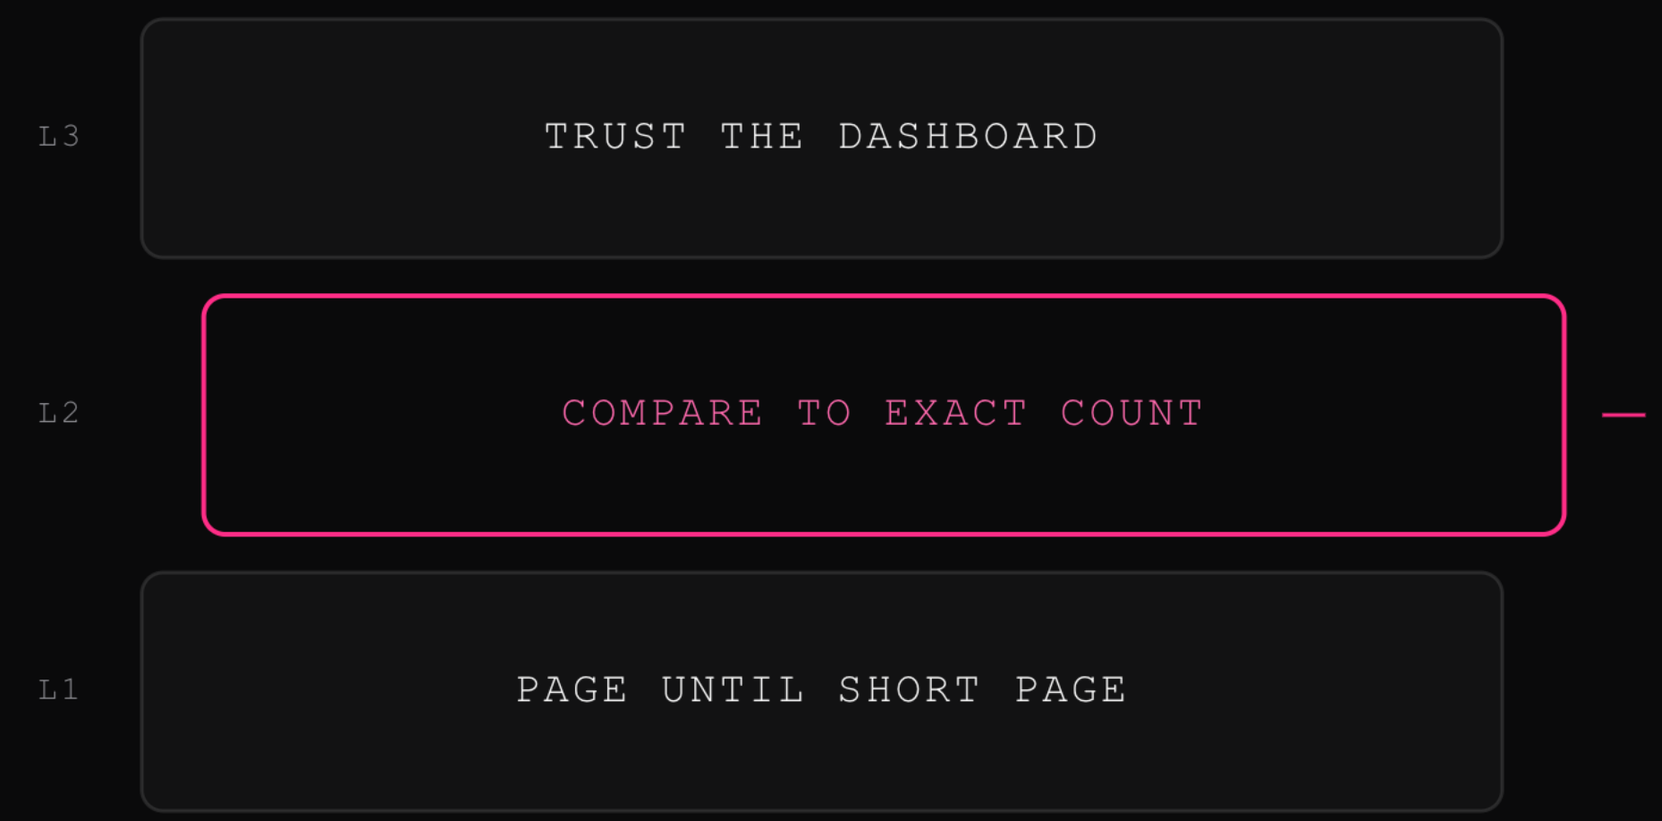

The first fix paged the bootstrap leads fetch. The evening fix swapped three reports fetches to restFetchAll(). Production then returned totalLeads 2352, per-list sums matching.

NO. 06 · THE GUARDS

Two guards that catch a capped list

Page until a short page comes back. Then compare any dashboard total to an exact count before you trust it. A client-side limit above the server cap does nothing.

Check one total against a count

A capped list and a full list look identical until you count.

RUN ONE EXACT COUNT
