'A human reviews it' is not a control _

The Financial Stability Board's agent guidance includes triggers: conditions that make the agent stop and ask.

RUN SESSION

arhem@verydian:~/four forms$ step 2

The FSB lists four forms of human oversight

Final report, October 15. Written for financial institutions, not binding. Human approval of all decisions is one of four forms, which the report says might suit cases where accuracy matters more than speed.

STDOUT

01 HUMAN IN THE LOOP

02 AI IN THE LOOP

03 HUMAN ON THE LOOP

04 HUMAN IN COMMAND

arhem@verydian:~/person vs trigger$ step 3

A person reviews, or a trigger decides

The report's example triggers: before approving financial transactions above a certain value, or taking actions that may cause irreversible harm. A named person is not a condition.

STDOUT

A PERSON	VS	A TRIGGER
— NAMES WHO REVIEWS		• VALUE OVER LIMIT
— SILENT ON WHEN		• IRREVERSIBLE HARM

arhem@verydian:~/how a trigger works$ step 4

The trigger fires and the agent stops and asks

The report's example controls include risk-based triggers for when an agent must seek human approval, confirmation or review. My reading: the condition is written in advance, not left to whoever looks.

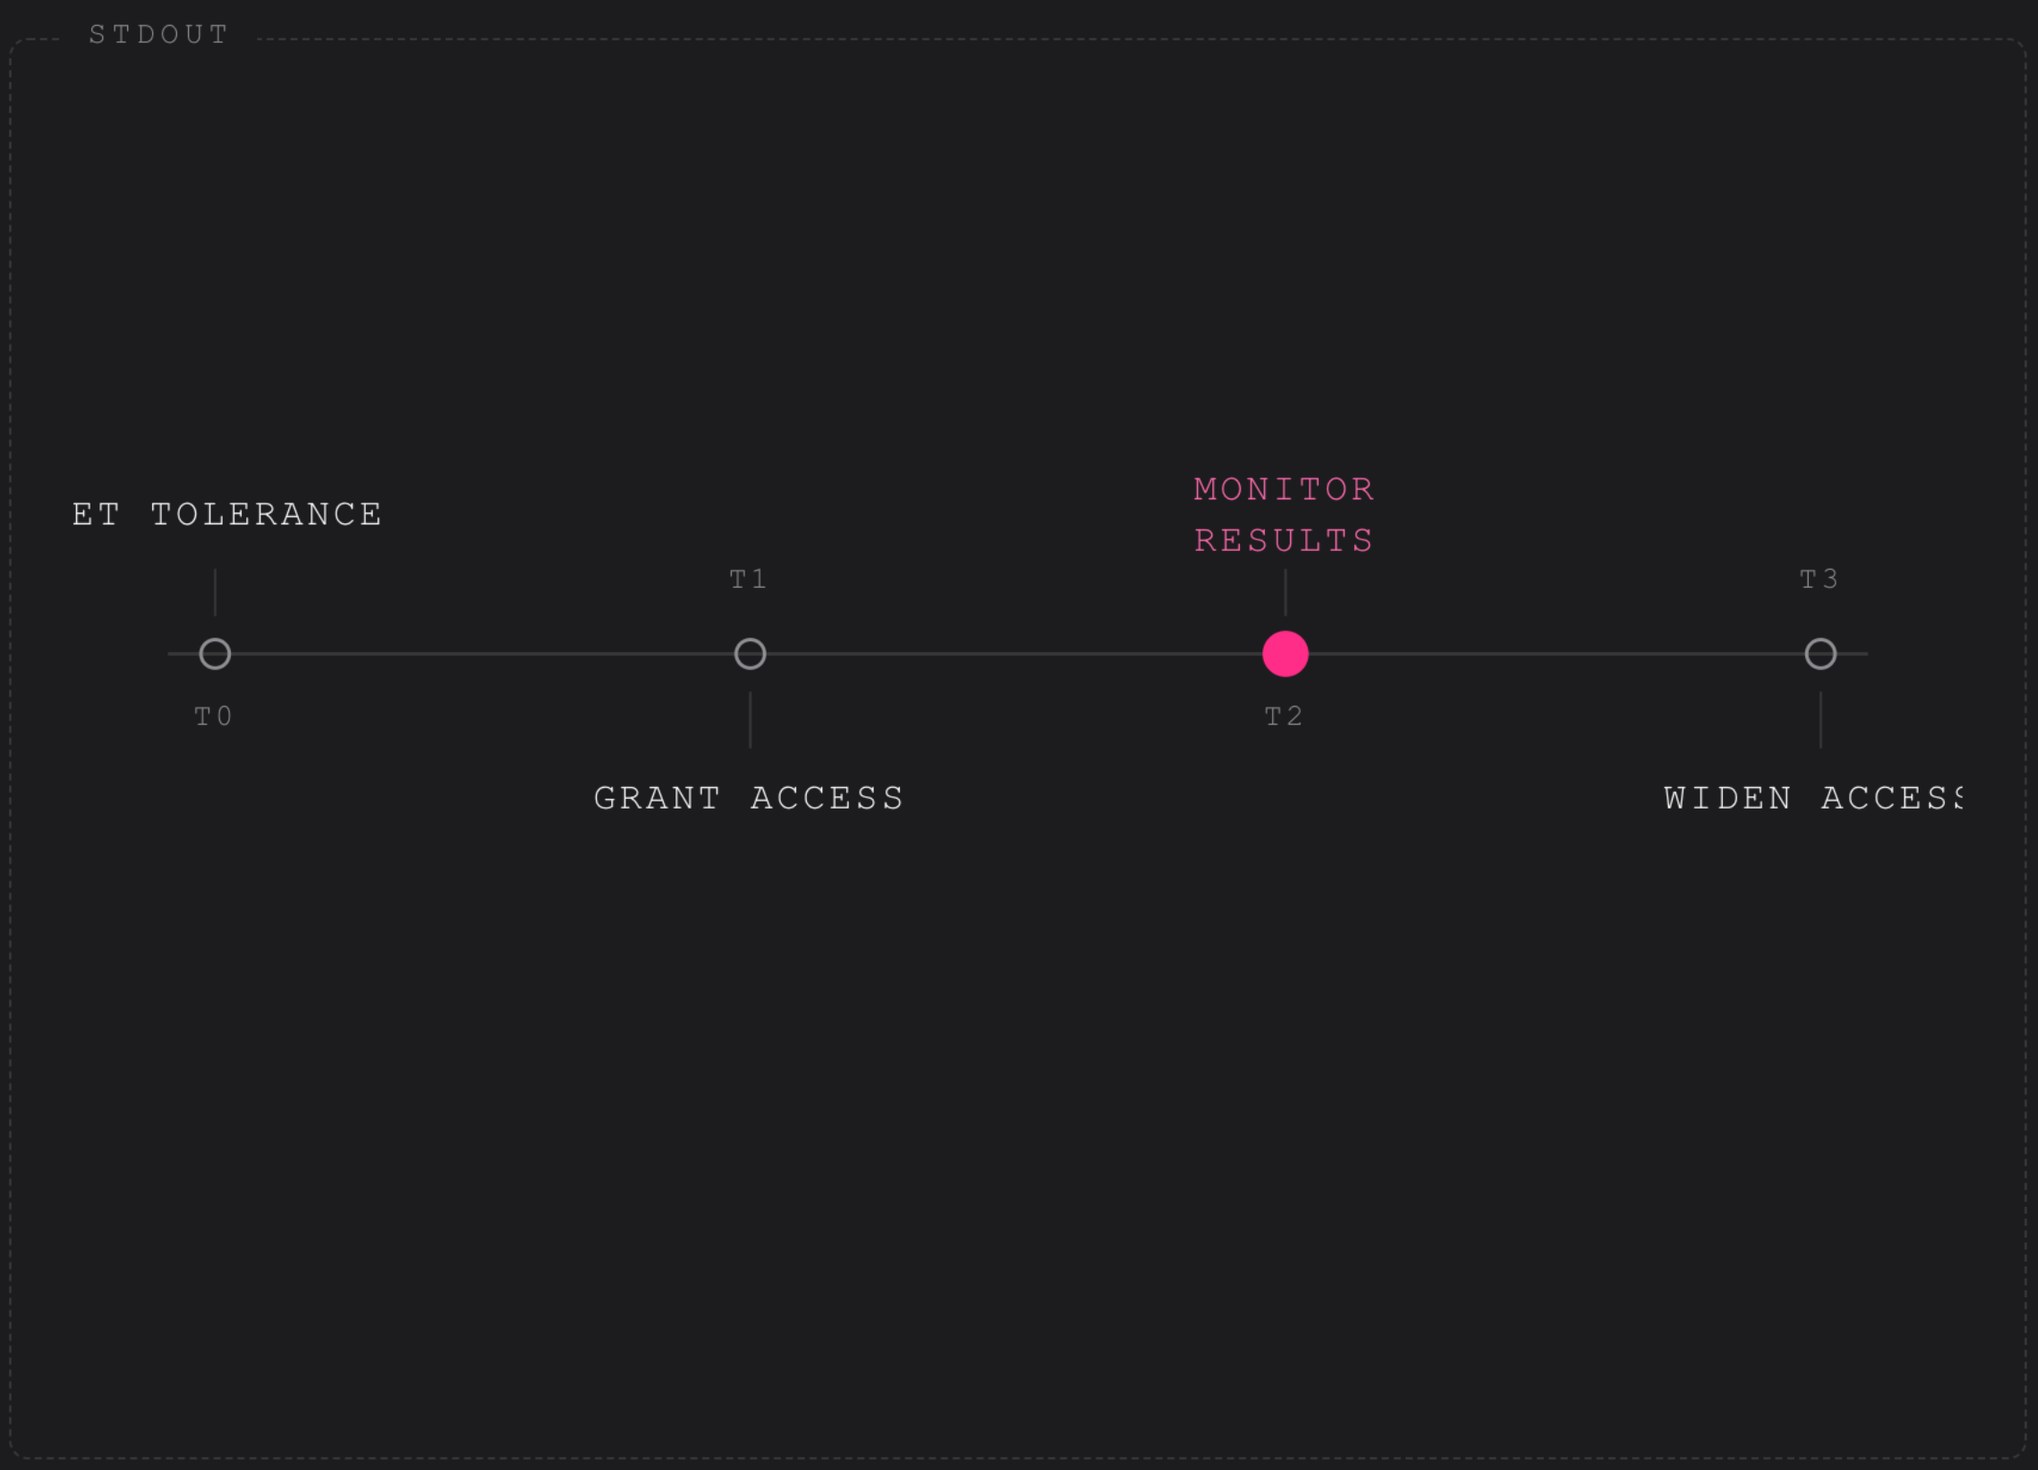

STDOUT

arhem@verydian:~/earned autonomy$ step 5

Monitored results decide how much autonomy

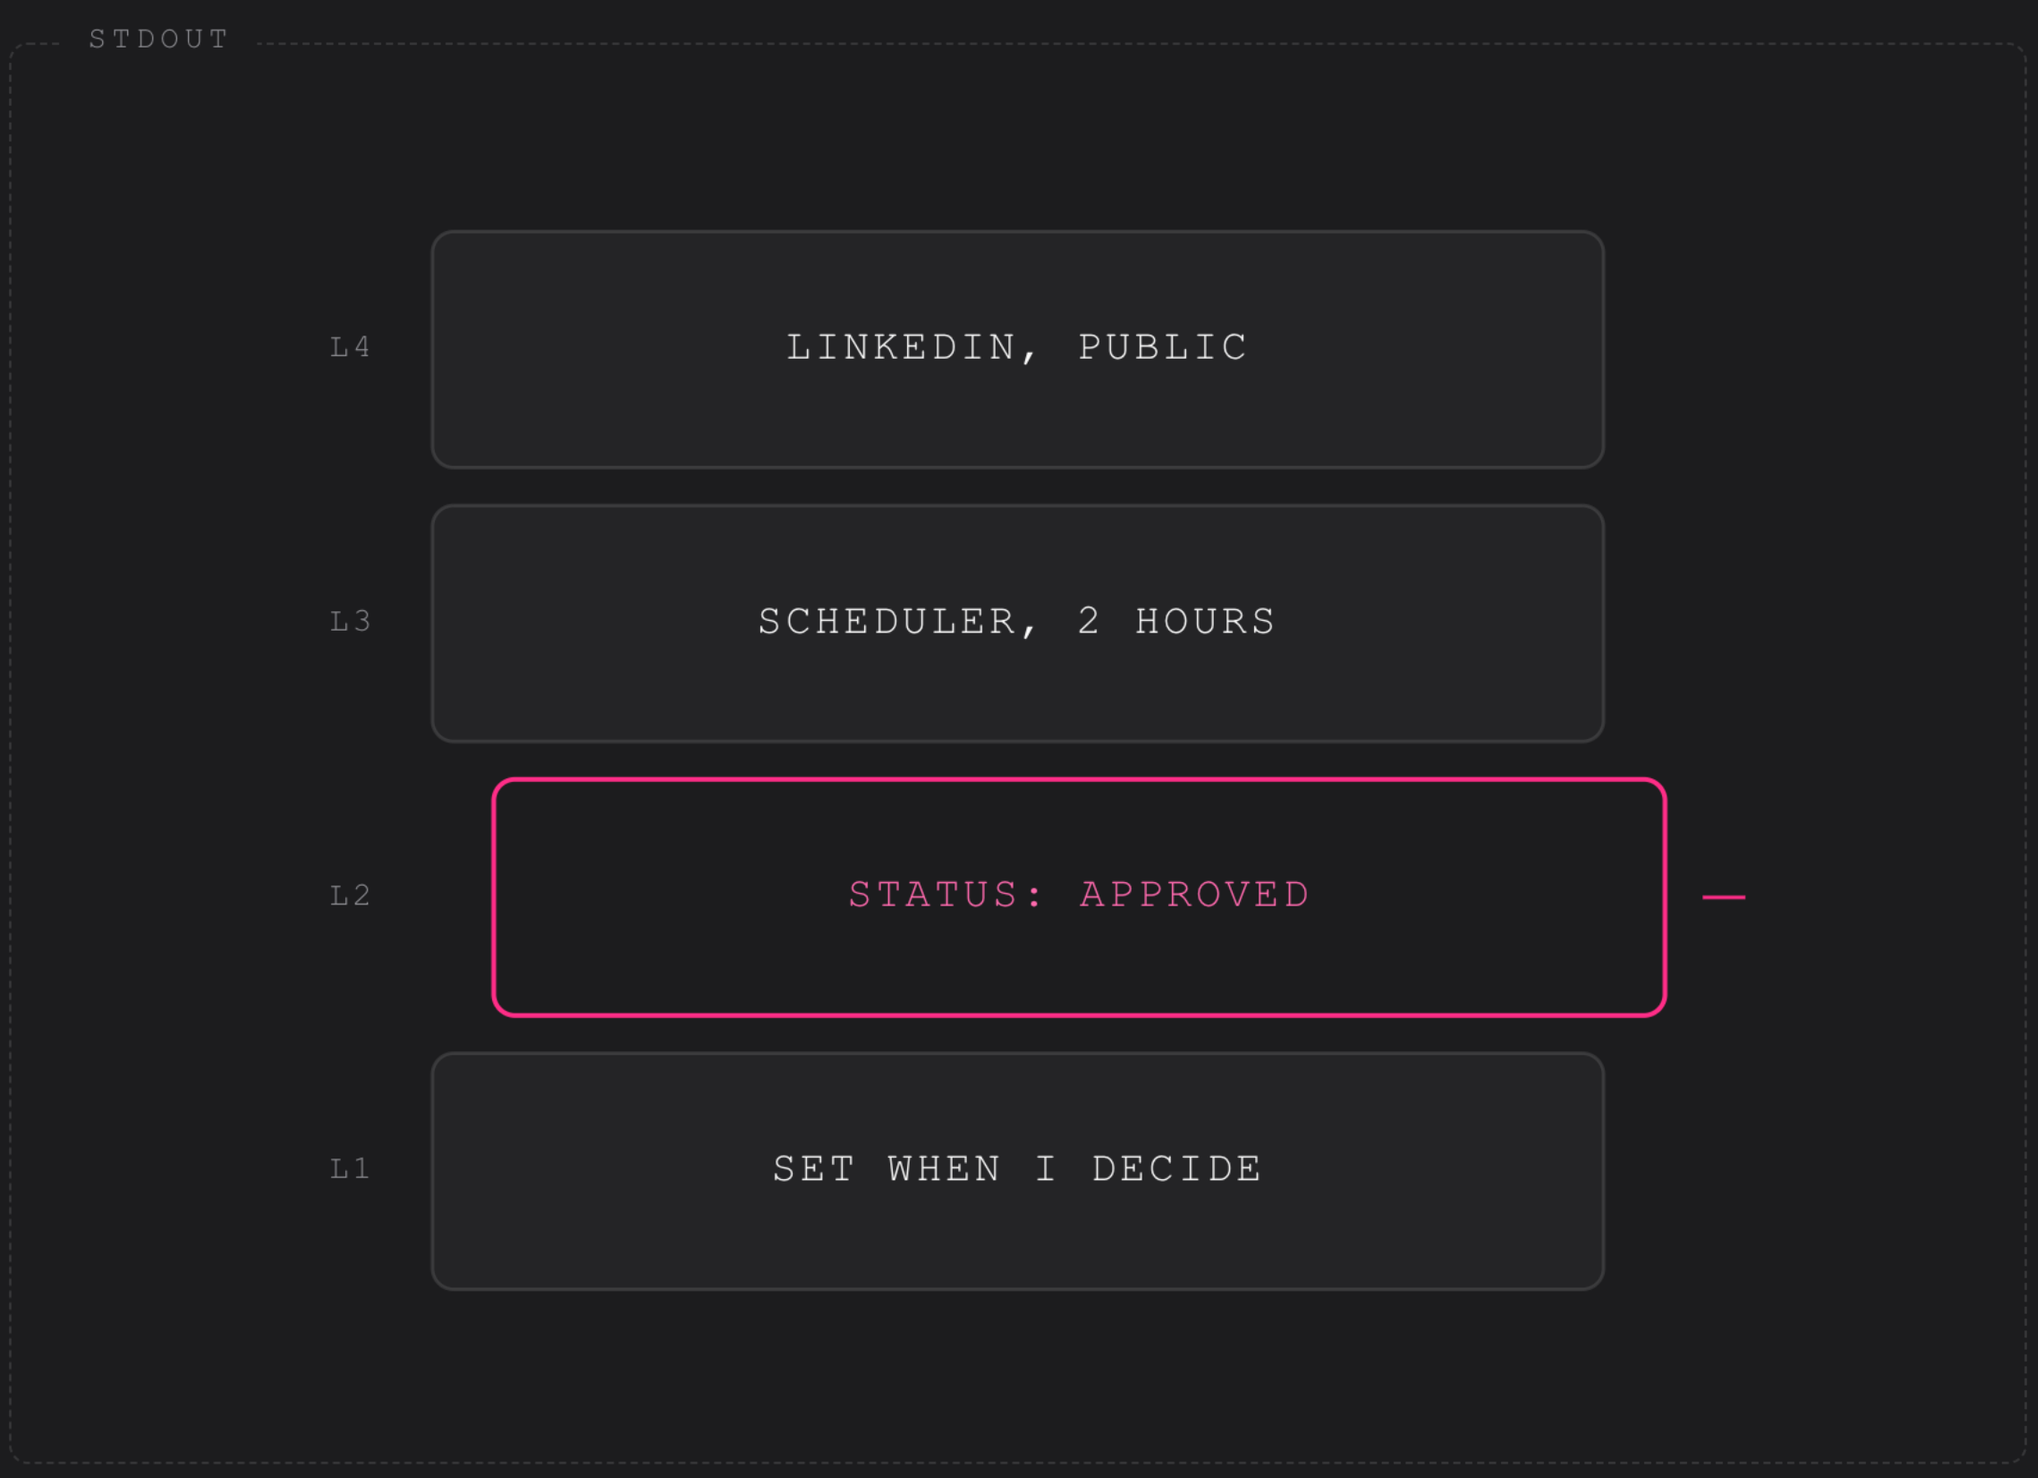

The report: set a risk tolerance per use case at inception, use monitoring results as a key basis for granting more autonomy, and widen access as confidence grows. Permission risk may compound multiplicatively.

arhem@verydian:~/the honest version$ step 6

My gate is a status value, not a trigger

The scheduler picks up posts marked Approved, and I decide when that status is set. That is a switch. Nothing defines a condition under which an approved post must wait for a second look.

Write the condition, not the reviewer

Mine would fire on anything hard to take back or off-pattern. Not built yet.

WRITE ONE TRIGGER
