

The Adoption Curve Nobody Talks About

Why the settle-back is not a failure signal

02 ·

Adoption hit 83% by month six, then settled at 60%

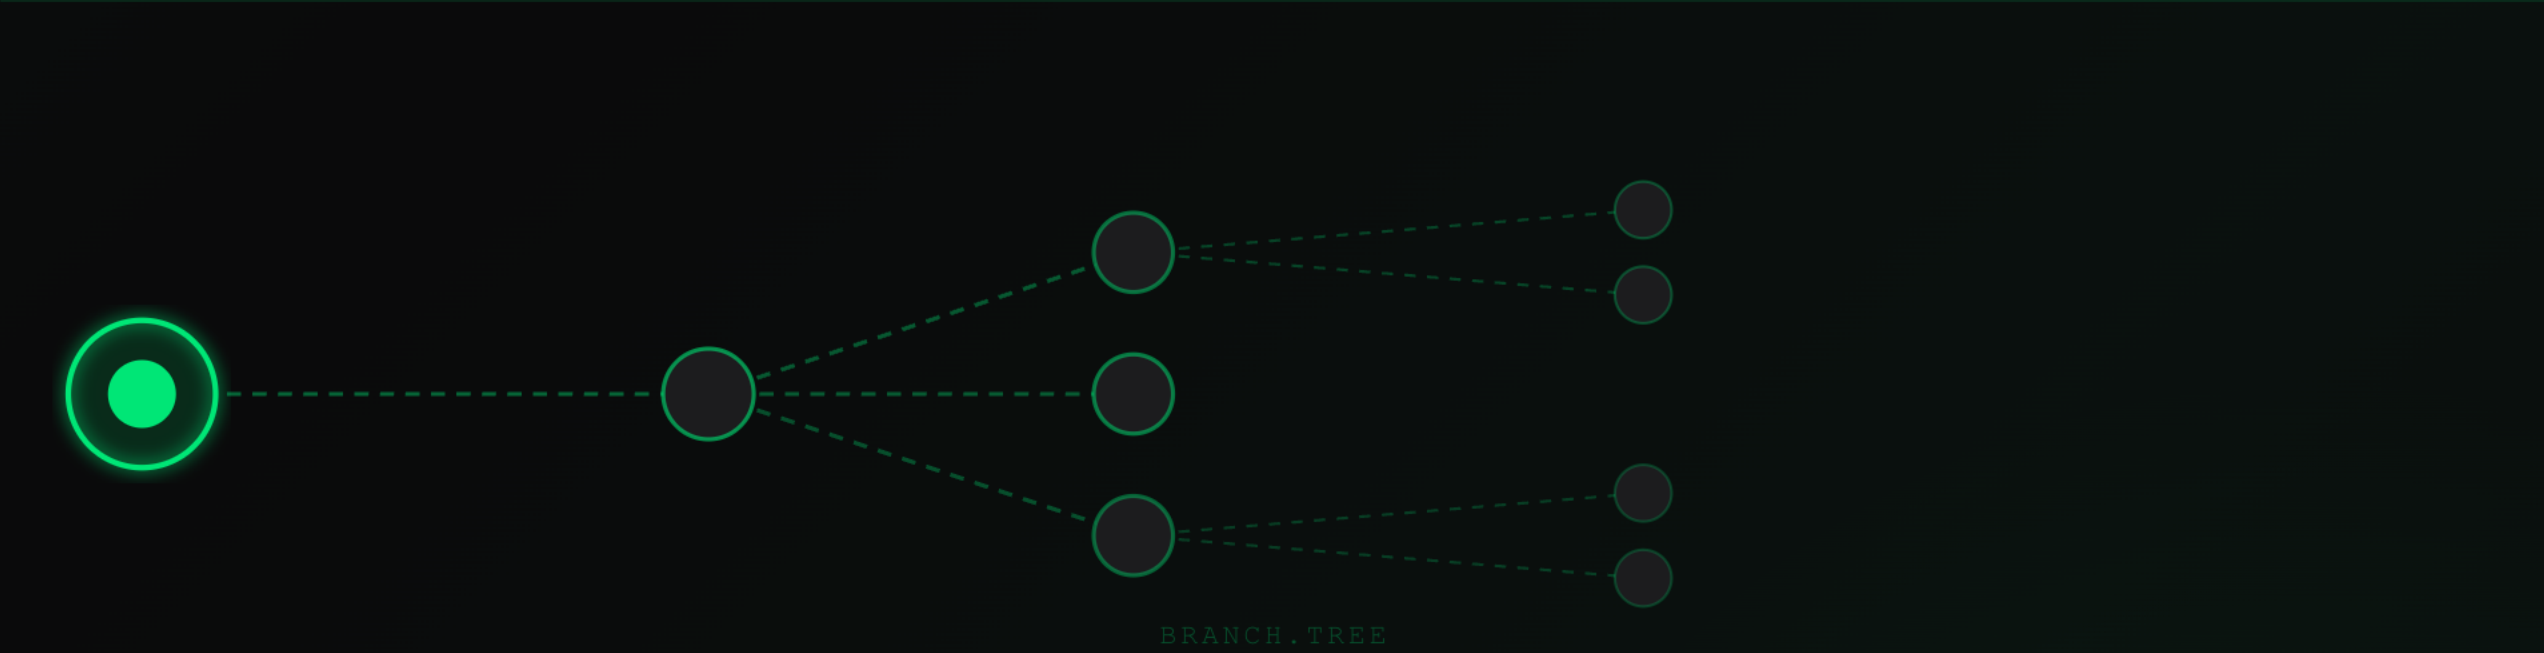

A 23-point drop that looks like failure on a graph, if you stop reading there.

03

The 83% peak includes a lot of misapplied usage

Early on, people try the agent on everything while they're still mapping where it actually helps.

04 ·

60% steady-state came with a 31.8% cycle-time drop

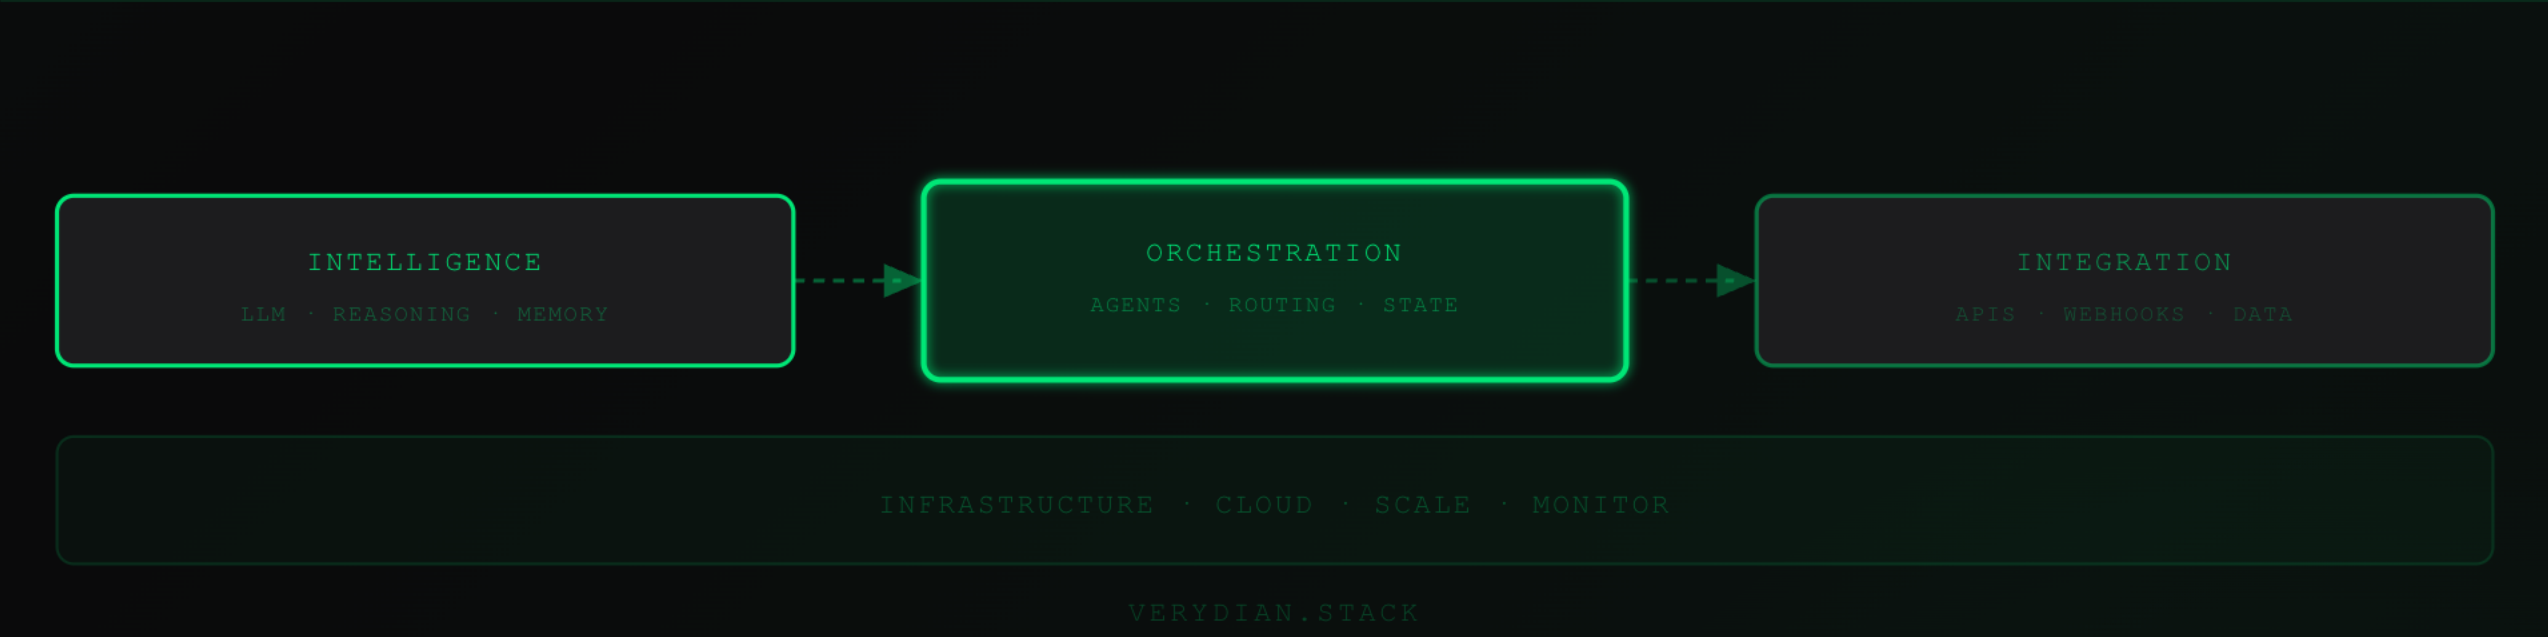

That is the workforce sorting itself out, not the workforce abandoning the tool.

05 ·

Adoption percentage is the wrong scoreboard

Track cycle time and error rate instead. Those tell you if the system is actually working.
