

Three years of GTM work revealed a bigger problem

I built Cloud 24 to solve the pipeline problem. The execution problem was underneath it the whole time.

ONGOING

02 ·

The clients winning weren't who I expected

Not the ones with the best product-market fit. The ones with operational leverage. Teams that moved on data, not memory. Processes that didn't collapse when one person was unavailable.

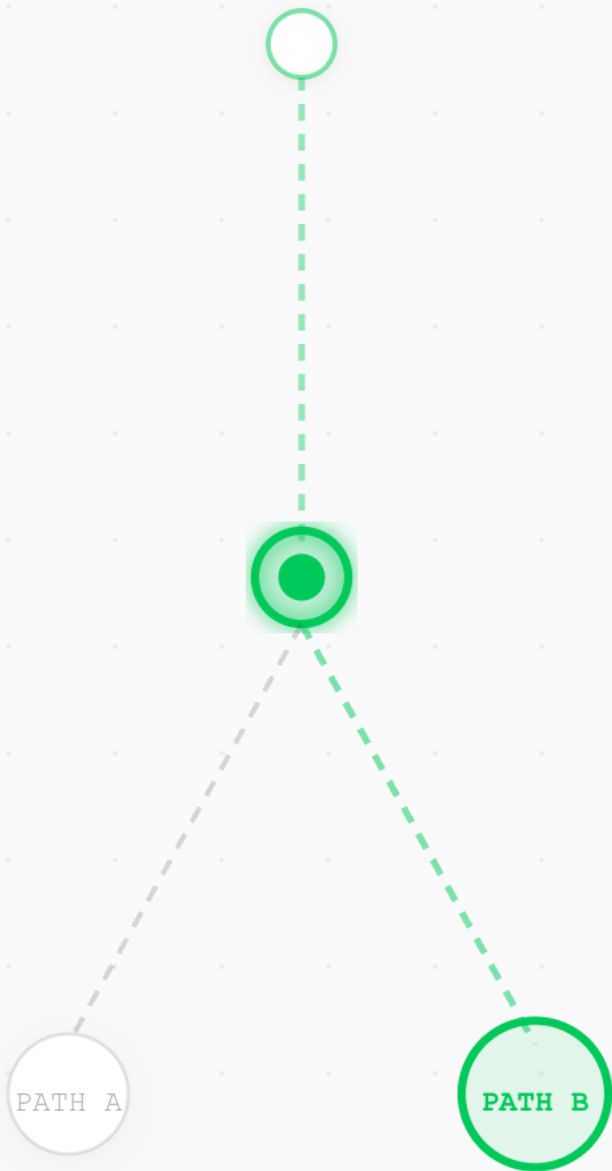

MOMENTUM

03 ·

The ones struggling had the same profile

Ops teams acting as glue between tools that didn't talk. Reports taking a week to compile. Reps doing data entry instead of selling. The execution layer was the ceiling — not the product.

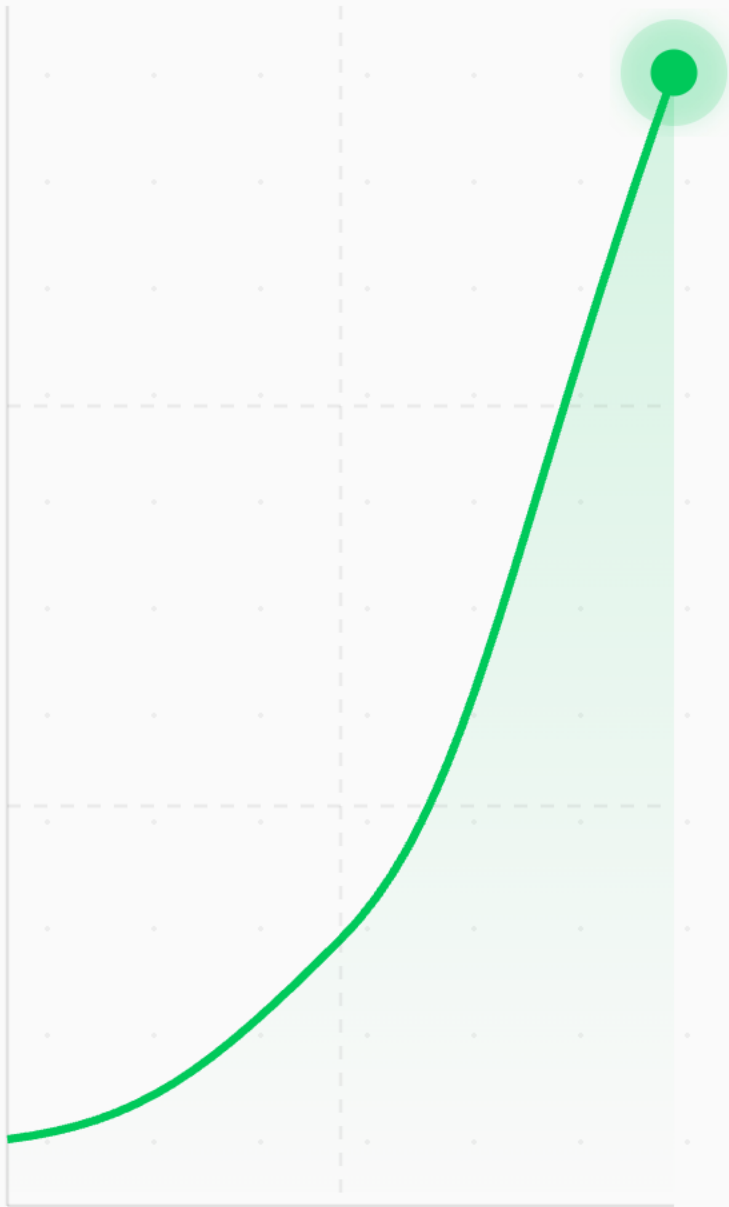

DECISION POINT

04 ·

Most companies don't have a pipeline problem

They have an execution problem. A gap between what's decided and what consistently happens — at scale, without someone manually moving the pieces. GTM was just where I saw it first.

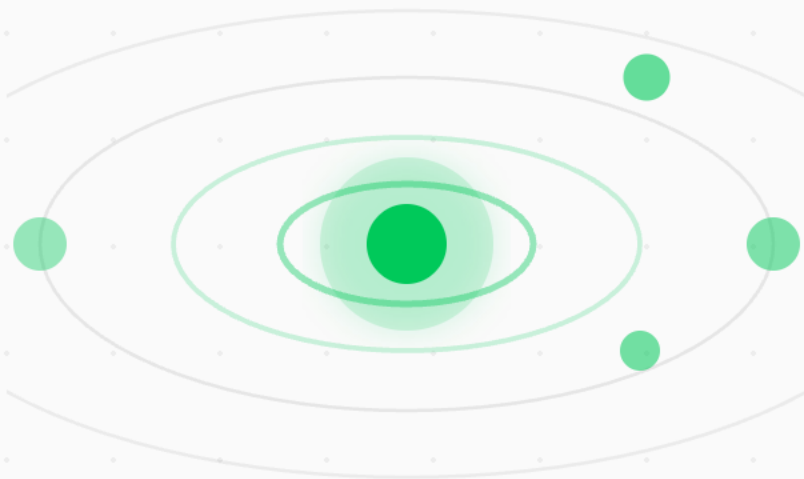

VELOCITY

05 ·

Verydian is the answer to the problem Cloud 24 kept hitting

Any process that follows rules, pulls from multiple data sources, and depends on a human to advance it — that's infrastructure waiting to be built. Agents can own that. Not assist. Own it.
