

I use both. For completely different things.

Getting this split wrong costs hours.

Claude Code: architecture and ambiguity.

Start here when the problem isn't fully defined.
Deep context, reasoning across a codebase,
decisions that are expensive to reverse if you rush
them.

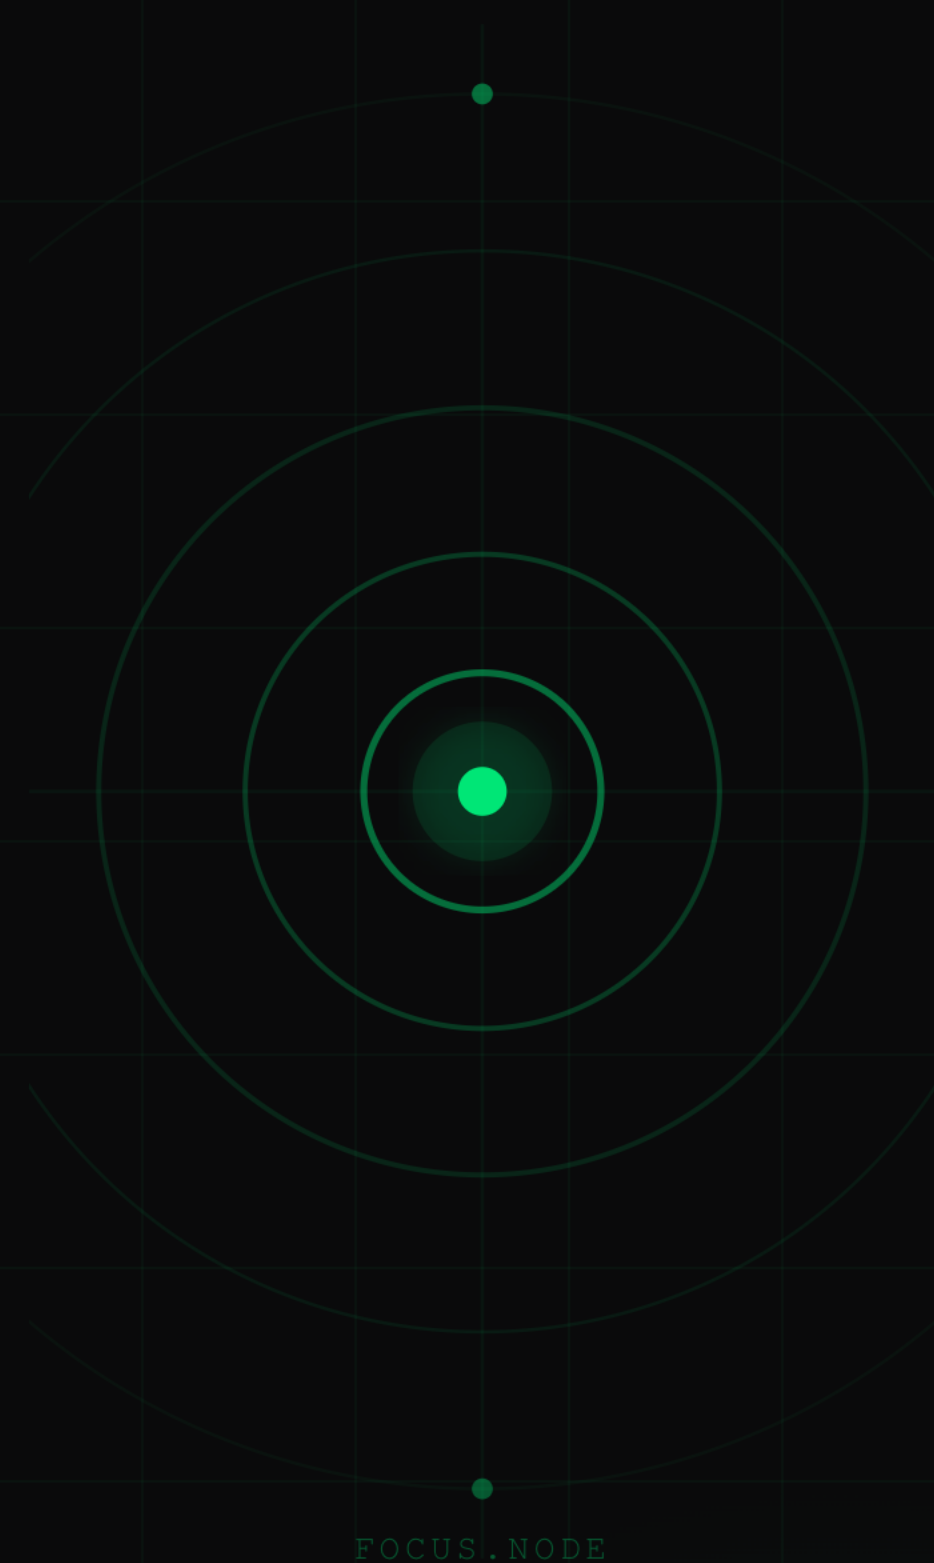

SYS.SIGNAL

03

03 ·

Codex: scoped execution, running in parallel.

3 or 4 jobs backgrounded at once. Tight specs, clear outputs, review the diffs when done. Fast because the scope is already locked.

04

0 4 ·

The mistake: treating them as interchangeable.

Codex on an architectural question gives you shallow output. Claude Code on a trivial task is slow and unnecessary. Wrong tool, wrong problem.

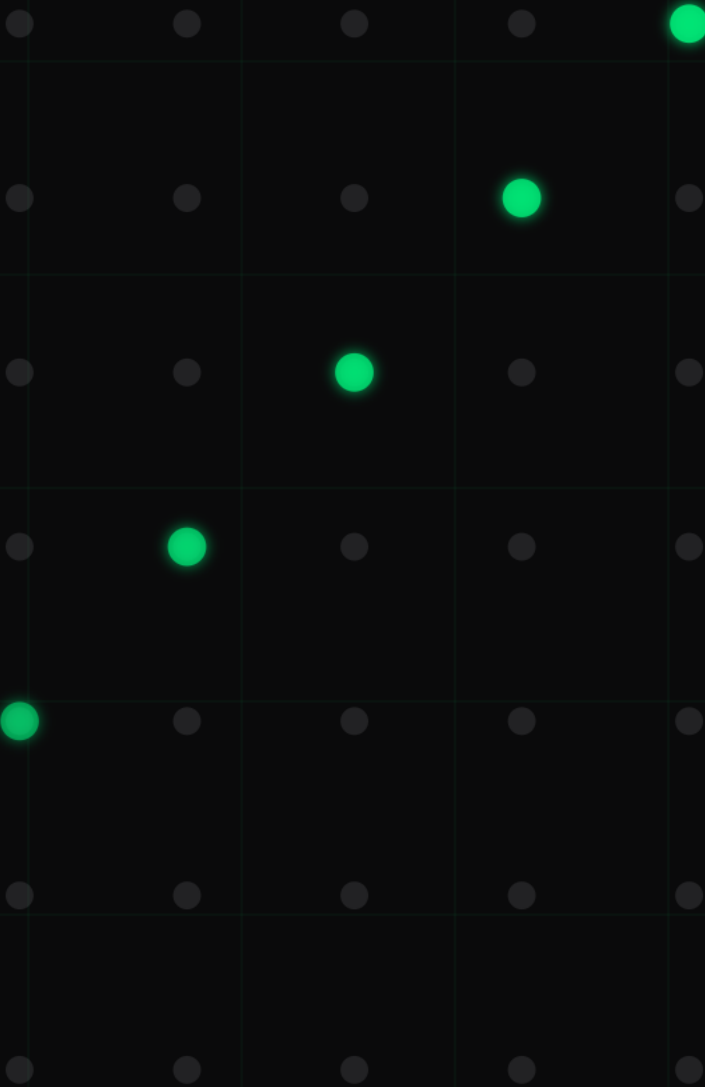

05

05 ·

The real question isn't which tool is better.

Does this problem need reasoning first or execution first? Answer that and the right tool is obvious.
