

Anthropic shipped Outcomes. Here's why it matters.

This changes the production reliability ceiling.

DENSITY.MAP

02 ·

What Outcomes does.

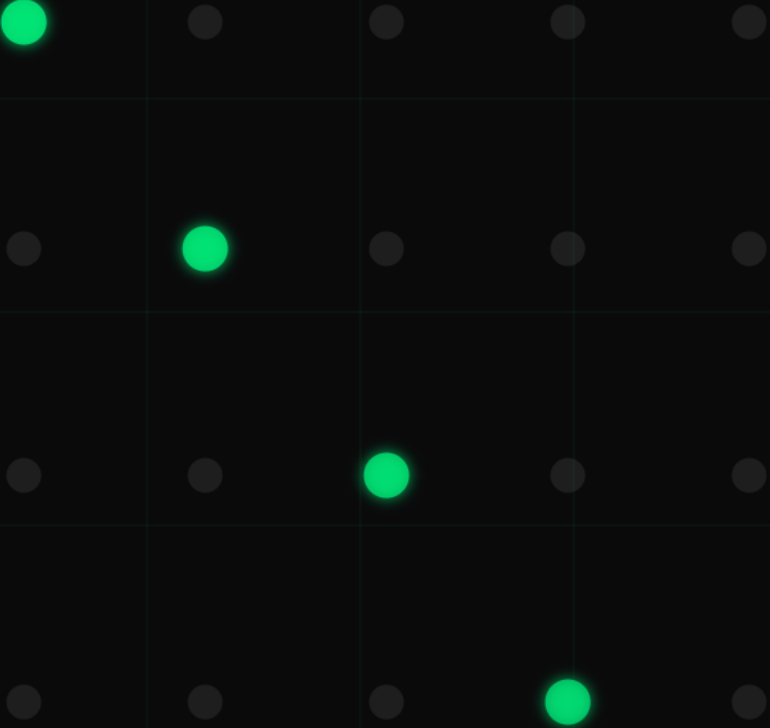

You define what good output looks like. The agent completes its work, evaluates against your rubric, and revises until it passes or escalates.

03 ·

The problem it solves in production.

Agents drift. Review queues grow. Manual checkpoints pile up. The operational overhead eventually erodes the value of the automation.

04 ·

The new contract:
meet a standard, not
just attempt.

The agent will hit this bar or escalate. That's a
different thing to put in a production workflow
than an agent that tries its best.

MATRIX.PATH

05

Dreaming: memory review between sessions.

Scheduled synthesis between runs. The agent consolidates context, updates its working model. Time between work becomes improvement, not downtime.
