

CODEx AUTO-REVIEW

Codex Auto-review adds no new permissions

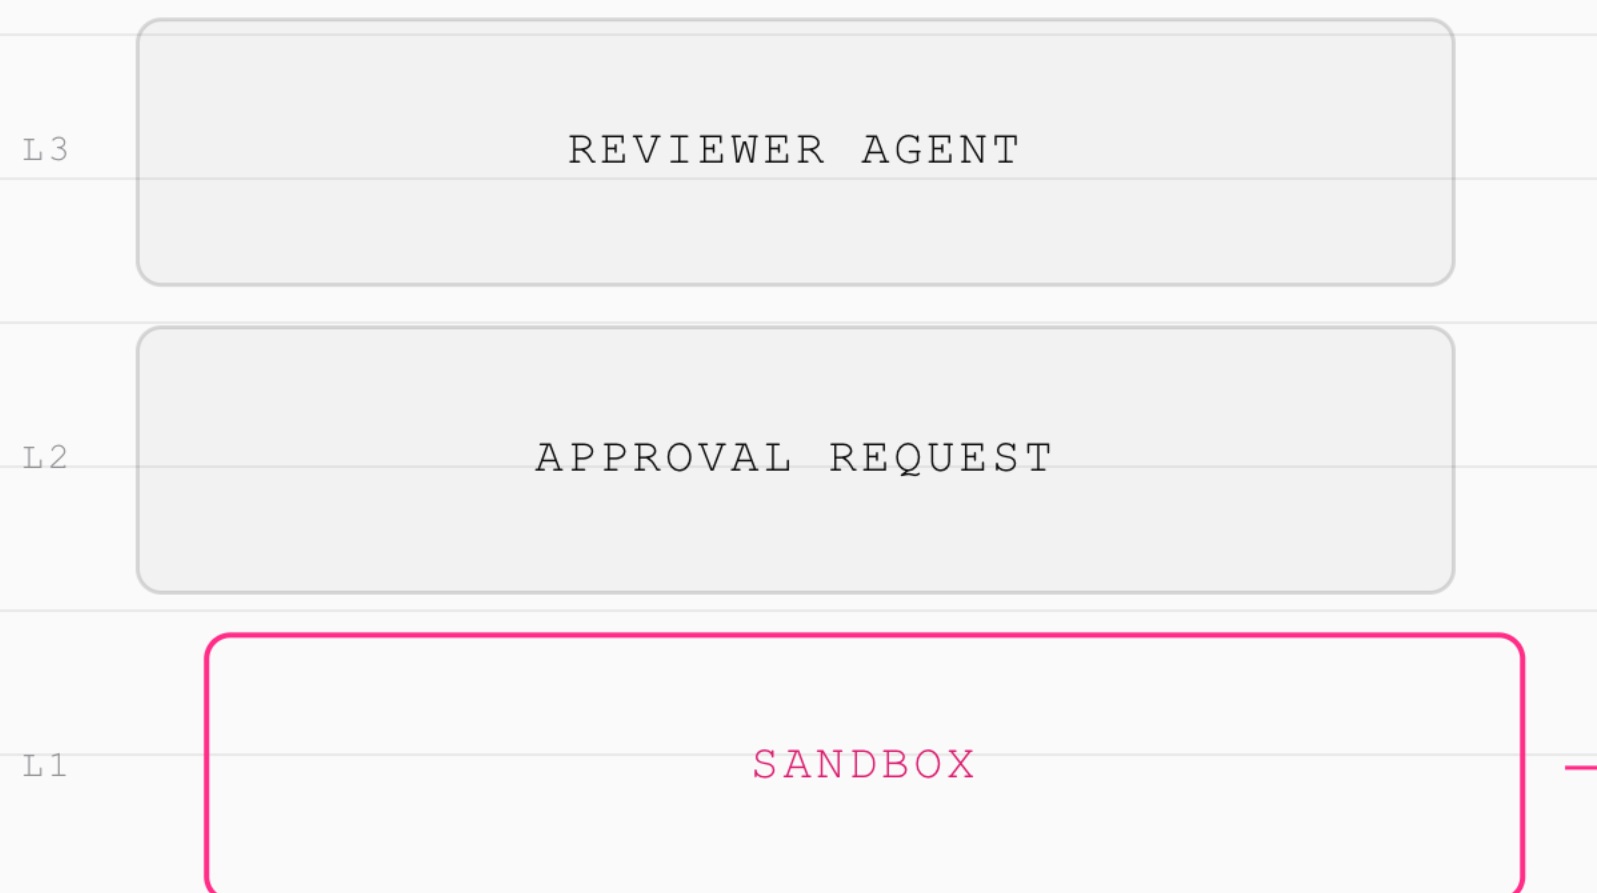

It only changes who answers when the agent asks to cross
the sandbox boundary.

OPEN THE LEDGER

The main agent works inside read-only or workspace-write. Crossing the boundary needs approval. Routine actions the sandbox already allows never reach a reviewer.

RECORDED SYSTEM

VERYDIAN

ENTRY 03 · THE ESCALATION PATH

What an escalation looks like

A reviewer agent decides, not a person, when approvals_reviewer is auto_review. After a denial the agent is told to find a materially safer path or stop and ask the user.

RECORDED SYSTEM

VERYDIAN

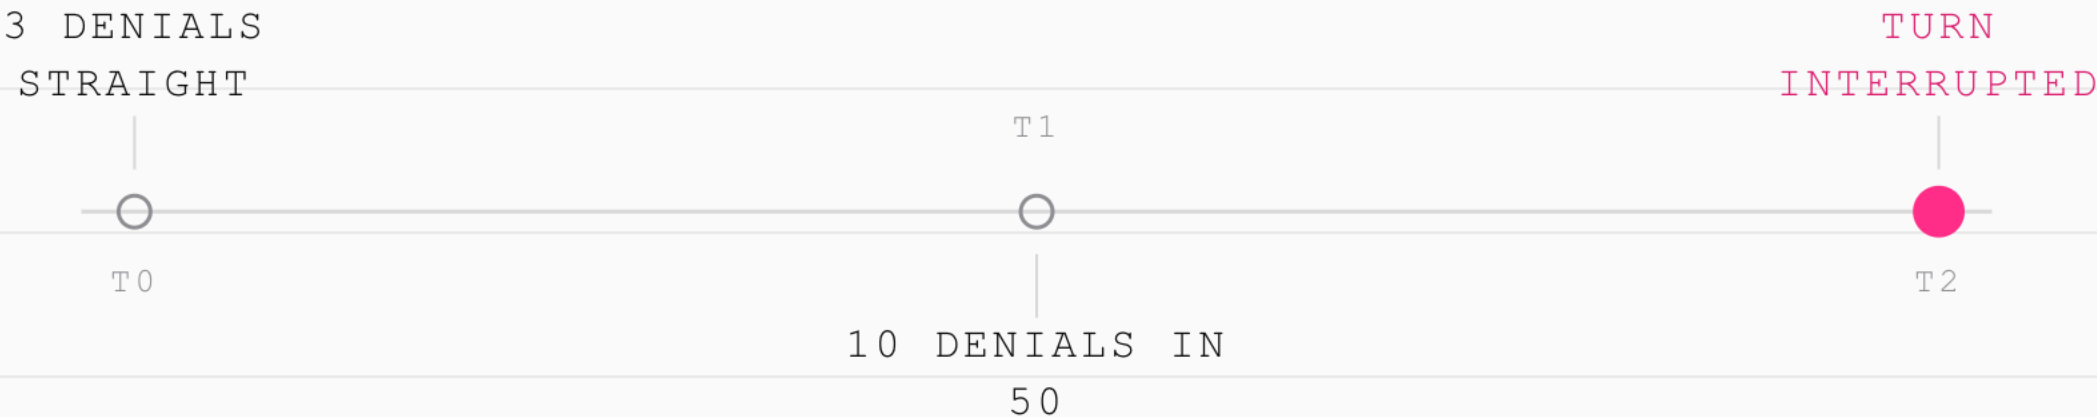

ENTRY 04 · CIRCUIT BREAKER

Repeated denials stop the turn

Auto-review interrupts the turn after 3 consecutive denials, or 10 denials within a rolling window of the last 50 reviews.

RECORDED SYSTEM

VERYDIAN

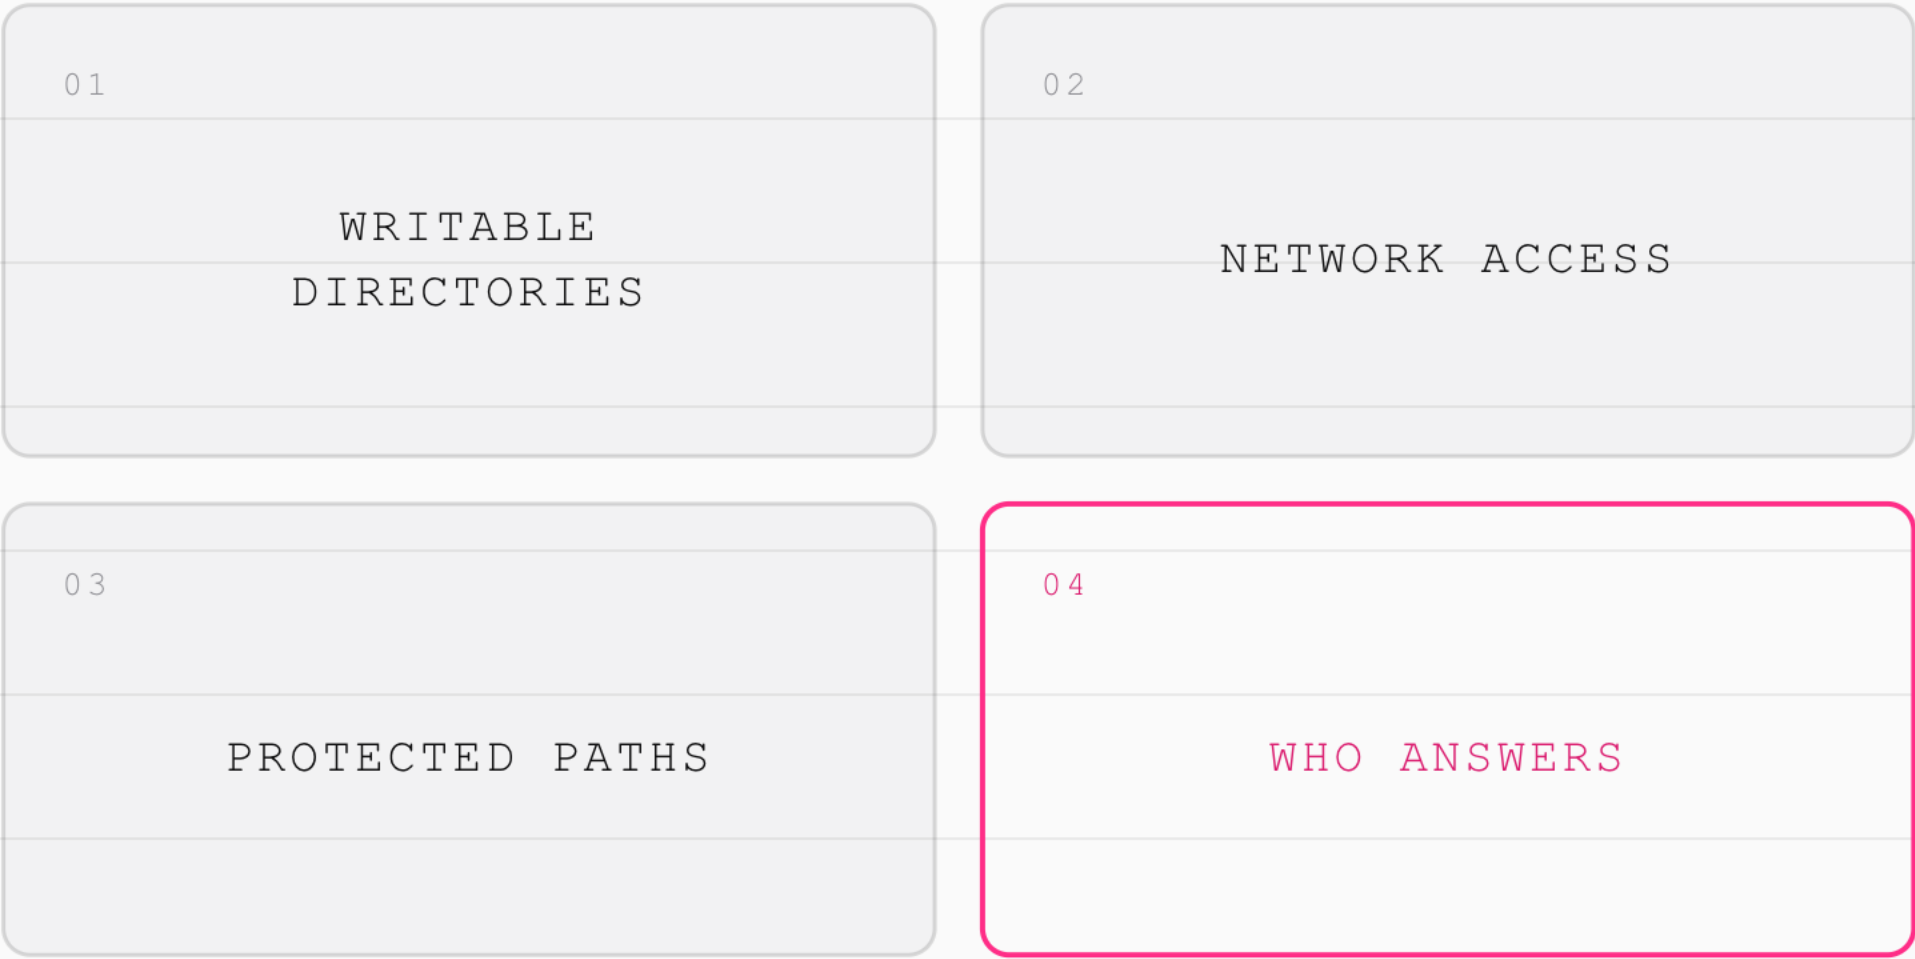

ENTRY 05 · UNCHANGED

What Auto-review does not change

It's a reviewer swap, not a permission grant. It doesn't expand writable directories, enable network access, or weaken protected paths.

RECORDED SYSTEM

VERYDIAN

ENTRY 06 · RETRY RULE

/approve doesn't skip the reviewer

/approve retries once, and the retry still goes through Auto-review. The reviewer still answers.

RECORDED SYSTEM

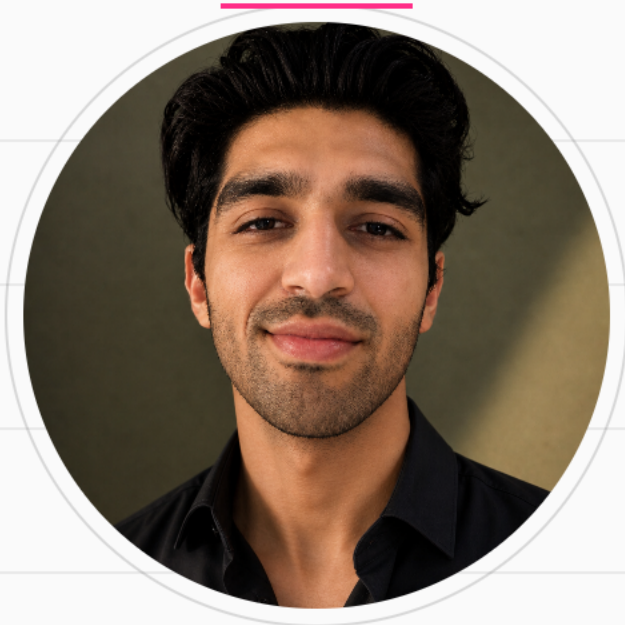

VERYDIAN

```
$ APPROVALS_REVIEWER = AUTO_REVIEW

$ ANSWERED BY: REVIEWER AGENT

$ /APPROVE: RETRIES ONCE

> RETRY: STILL GOES THROUGH
  AUTO-REVIEW
```

Know who answers when nobody's watching

Check who answers the approval prompt in every unattended agent run.
