

BUILDER LOG

I stopped reviewing
every line Claude
Code writes

Here's exactly where I drew the new line, and the bug that
almost got past it.

READ ON —

THE OLD HABIT

I was reviewing everything the same way

Boilerplate got the same scrutiny as a live database migration. That's wasted attention, not diligence.

EXHIBIT 02

VERYDIAN

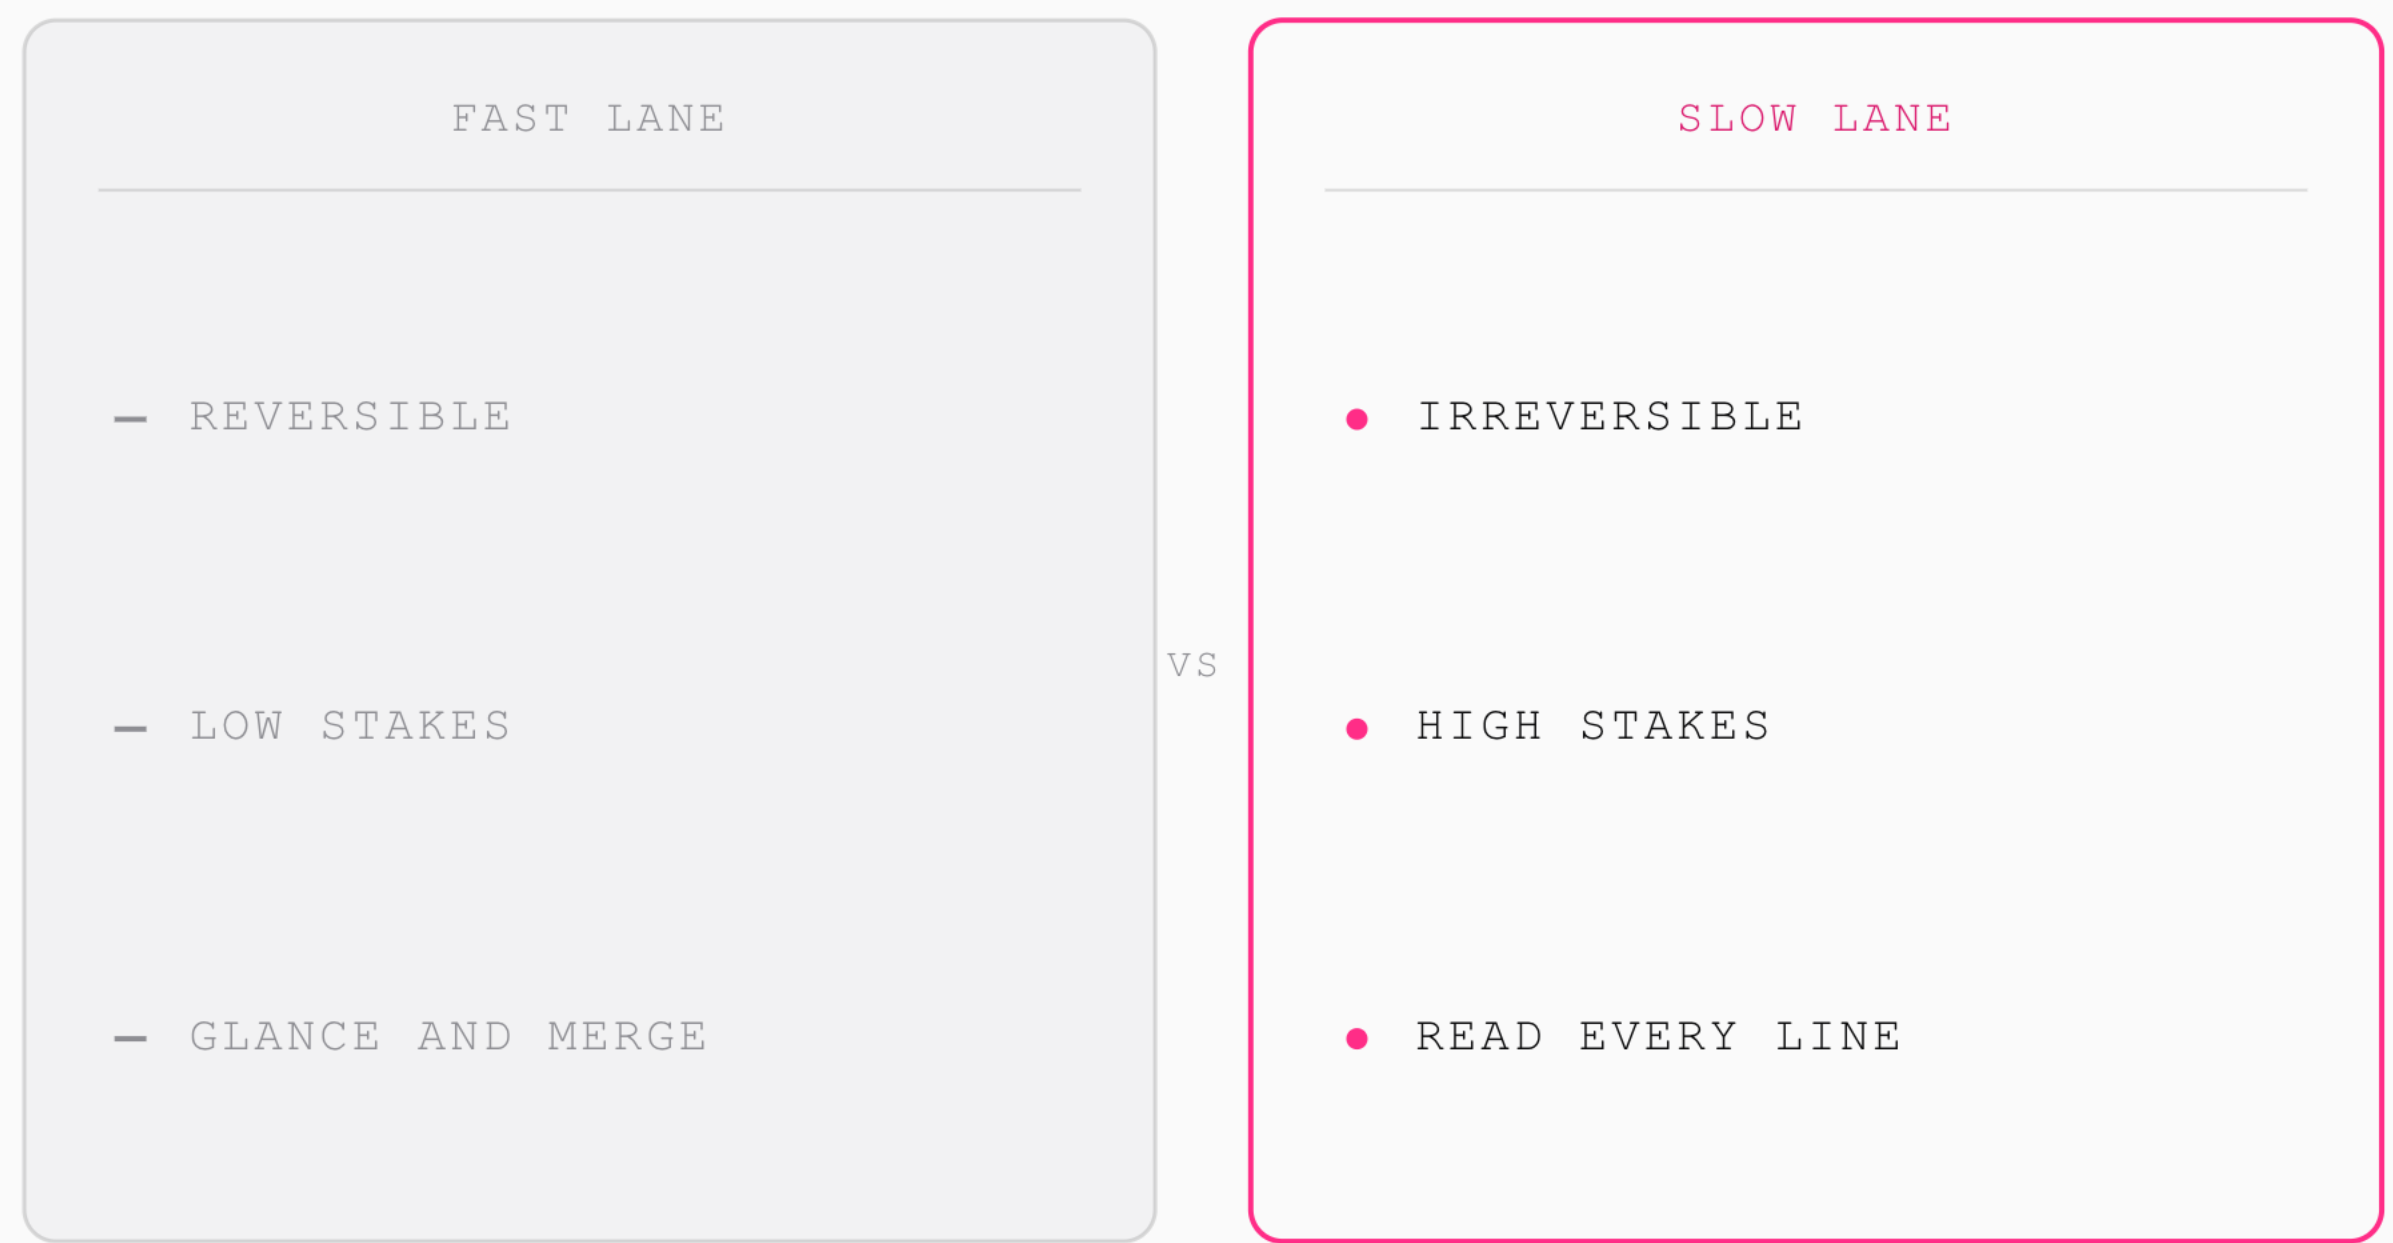

THE TIER SYSTEM

Two buckets, decided before I look

Reversible and low-stakes moves fast. Irreversible or high-stakes gets read character by character.

EXHIBIT 03

VERYDIAN

THE NEAR MISS

The migration that almost got through

Clean syntax, sensible names, ran without errors. It dropped a column instead of renaming it.

EXHIBIT 04

VERYDIAN

```
$ > RUN MIGRATION --DRY

$ OK: 0 ERRORS

$ > INSPECT OPERATION

> WARNING: COLUMN DROPPED

$ NOT RENAMED, DATA LOST
```

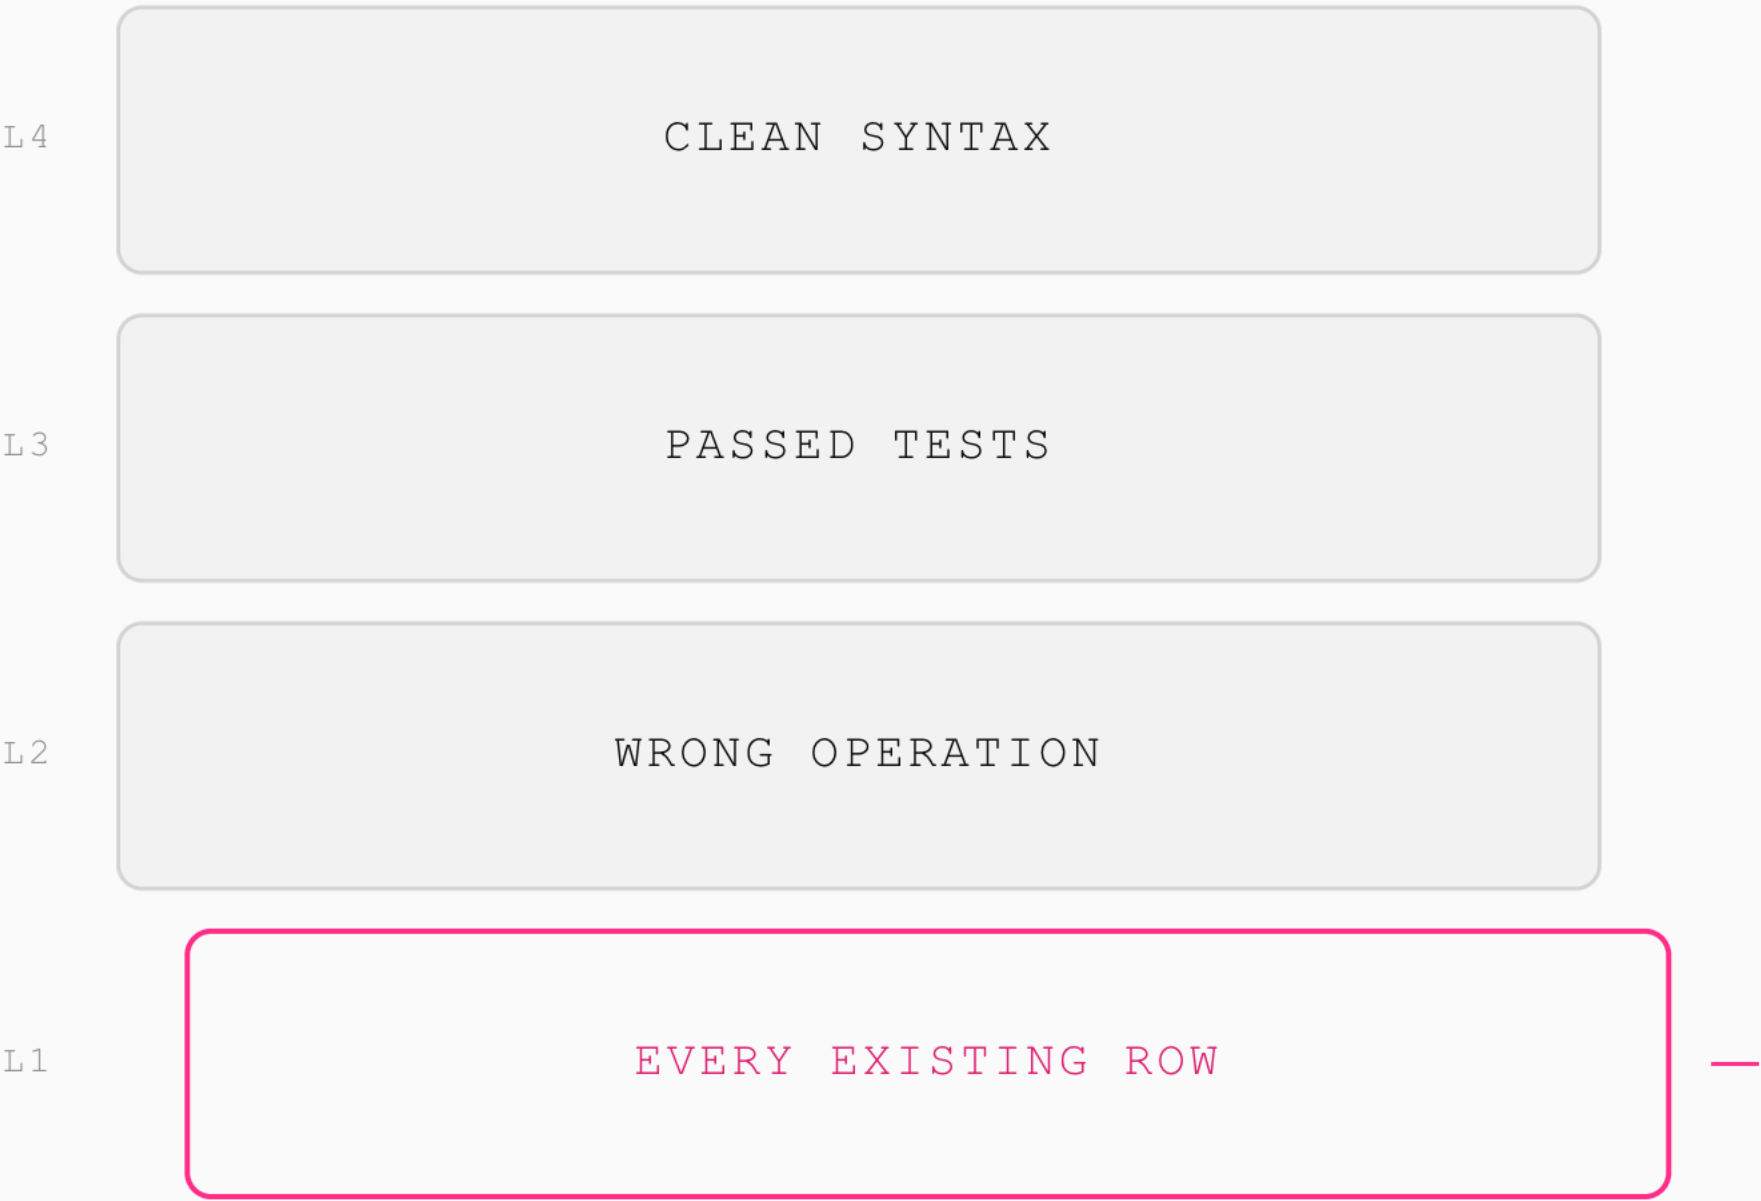

THE LESSON

Same intent, wrong operation, all the data

The bug wasn't in the syntax. It was in an operation that looked right and wasn't.

EXHIBIT 05

VERYDIAN

Know the bucket before you decide how hard to look

That's the actual skill, not reviewing everything or nothing.
