

REVIEW BOTTLENECK

The swarm backlash was never about capability

Anthropic shipped agents that write code faster than humans
can check it. That's the whole story.

ENTER

● EXHIBIT 02 · EXECUTION

Execution stopped being the constraint

Swarms of agents can produce a week of engineering output before lunch. Speed was solved.

● EXHIBIT 03 · CONSTRAINT SHIFT

The bottleneck moved, it didn't vanish

Constraints don't disappear when you remove them. They relocate to the next weakest point in the chain.

● EXHIBIT 04 · PROCESS DEBT

Old review process, new volume, quiet breakage

One engineer reading one PR carefully does not scale to a swarm. It just fails without anyone noticing.

● EXHIBIT 05 · VERIFICATION GATES

Every stage in my pipeline has a hard gate

Nothing advances until a script fails loudly on the real failure mode for that stage. No vibes.

```
$ > GENERATE 40 FILES

$ > RUN VALIDATOR

> FAIL: 3 SPEC ERRORS

$ > FIX AND RE-RUN

$ PASS: SHIP QUEUED
```

● EXHIBIT 06 · THE REAL SKILL

Verification is the skill, not prompting

Building checks that scale as fast as generation does matters more than getting a better prompt.

If 10x volume would break your
review, that's the gap

Not your agents. Your gates.

AUDIT THE GATE
