ROW HEIGHT CONTRACT

# One 49.3px button broke my CRM's grid

In July, a two-line button was 9.3 pixels over the row height.
With virtualization, that is a broken contract.

ENTER

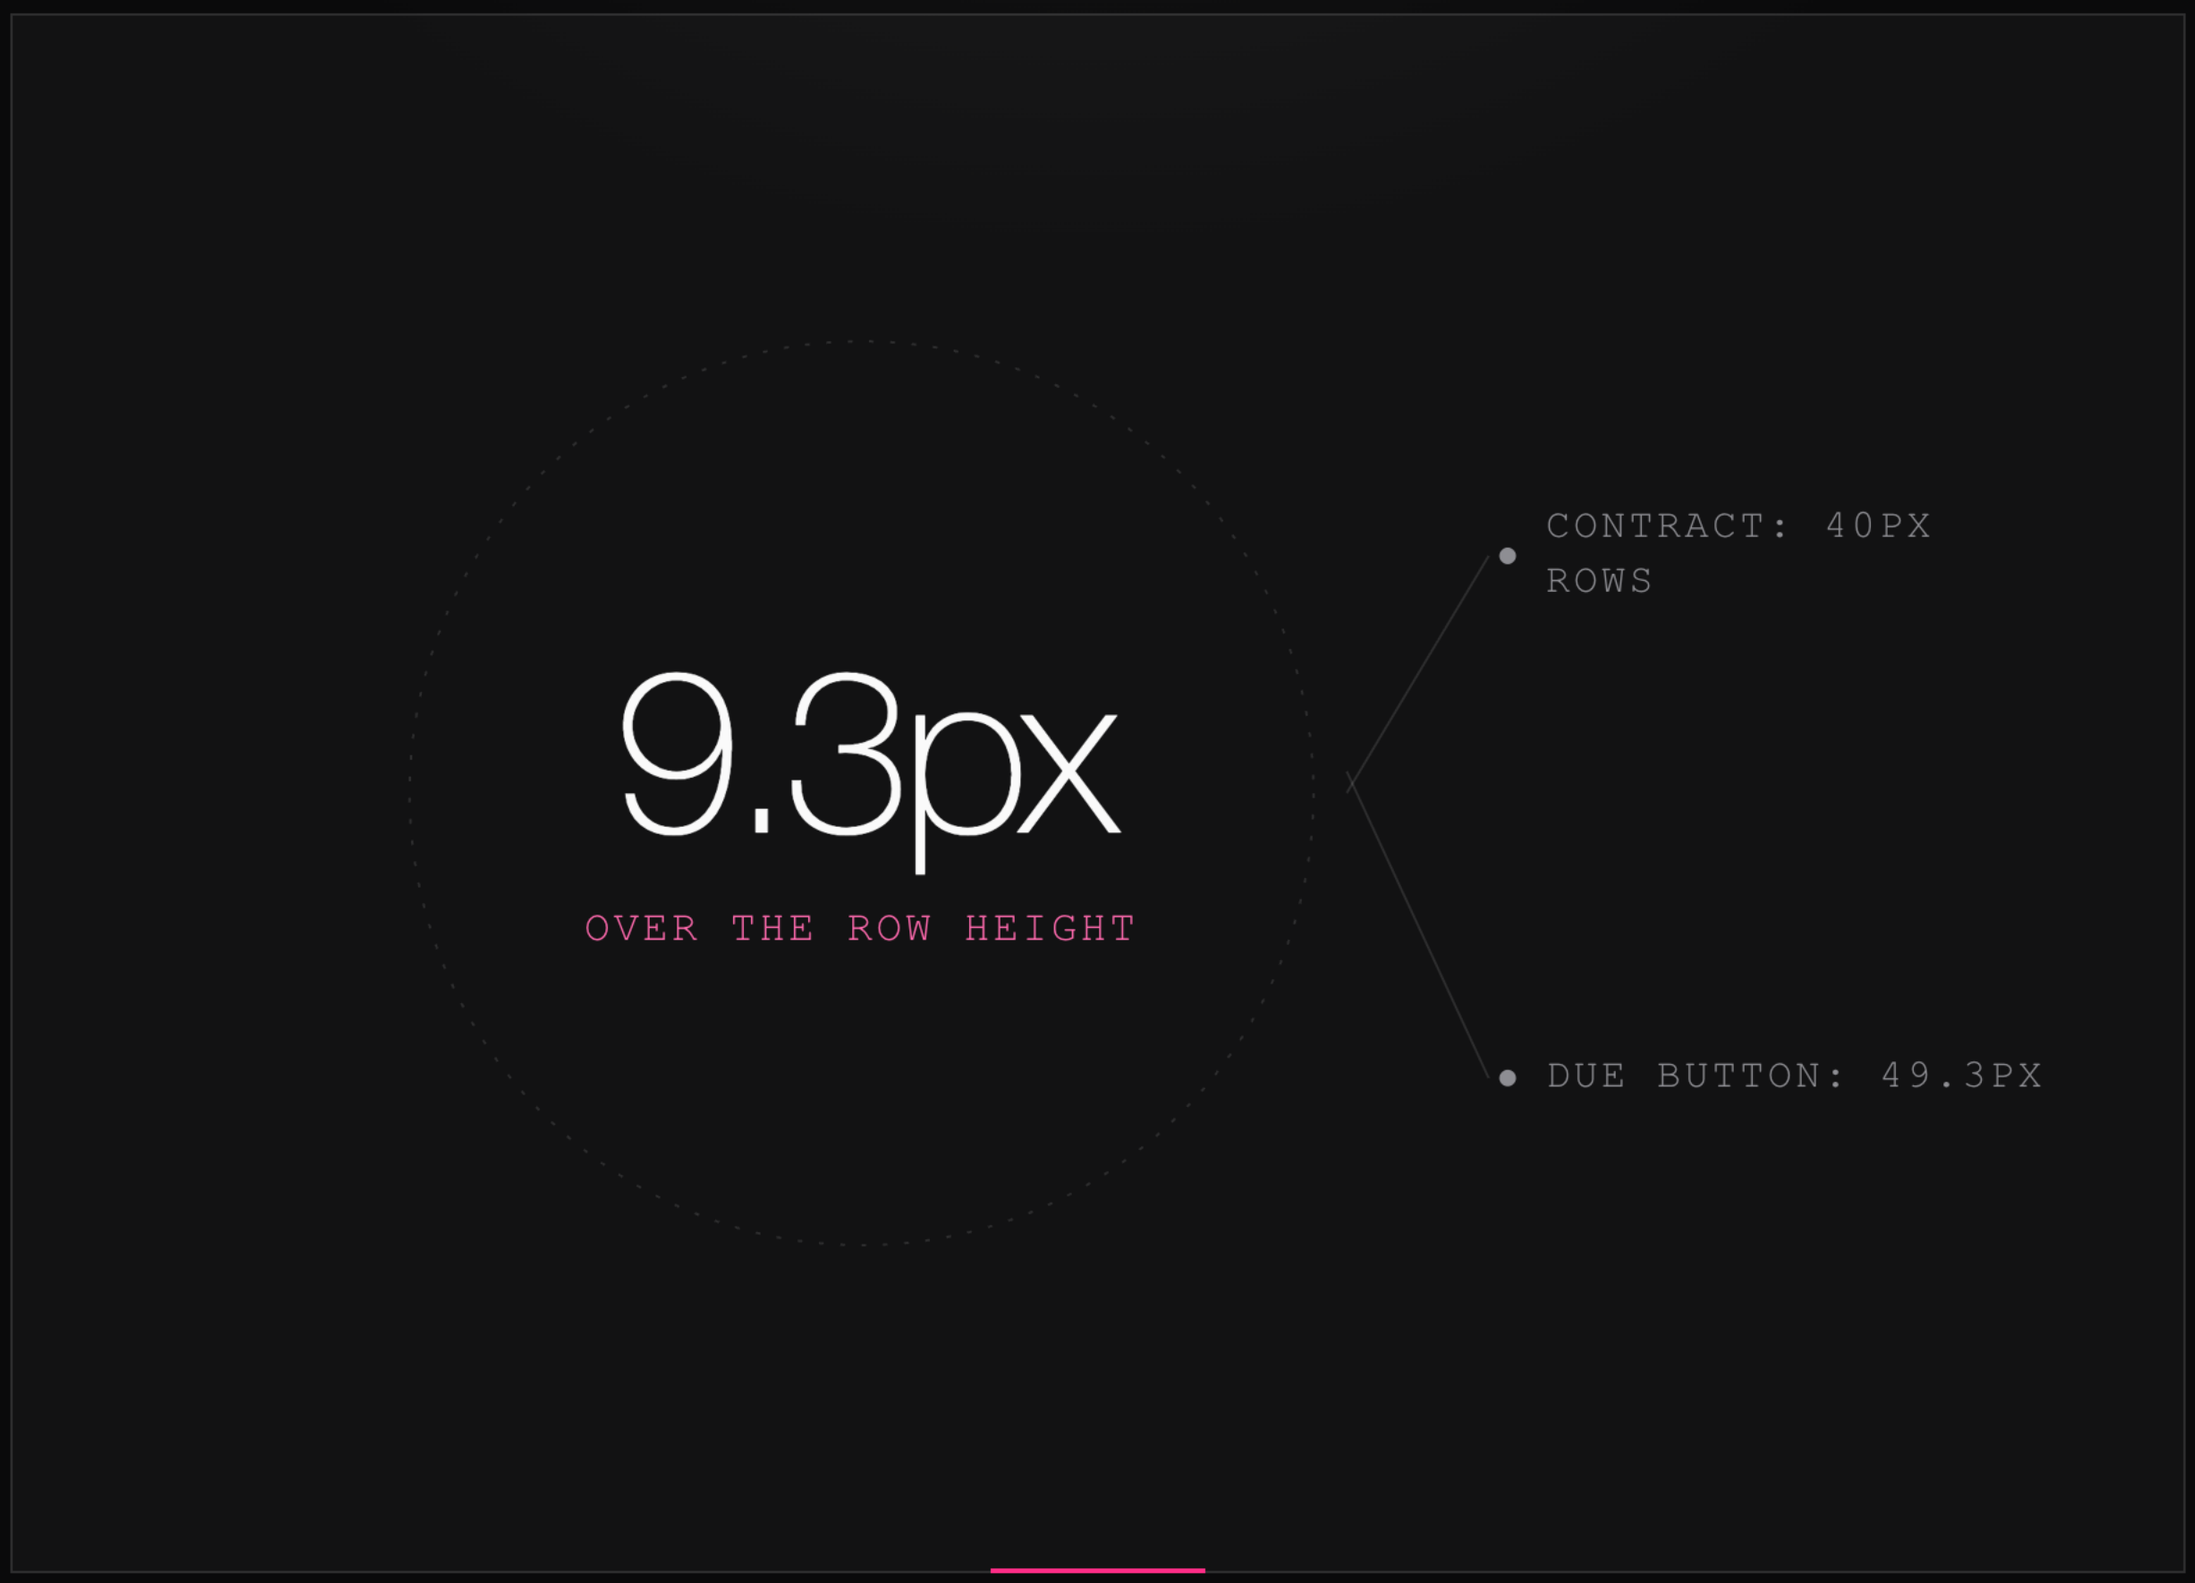

EXHIBIT 02 · THE OVERSHOOT

# 40px was the contract. The button was 49.3px.

The fixed row height is a CSS variable, --grid-row-h, set to 40px. One two-line due button rendered 49.3px tall, 9.3px over.

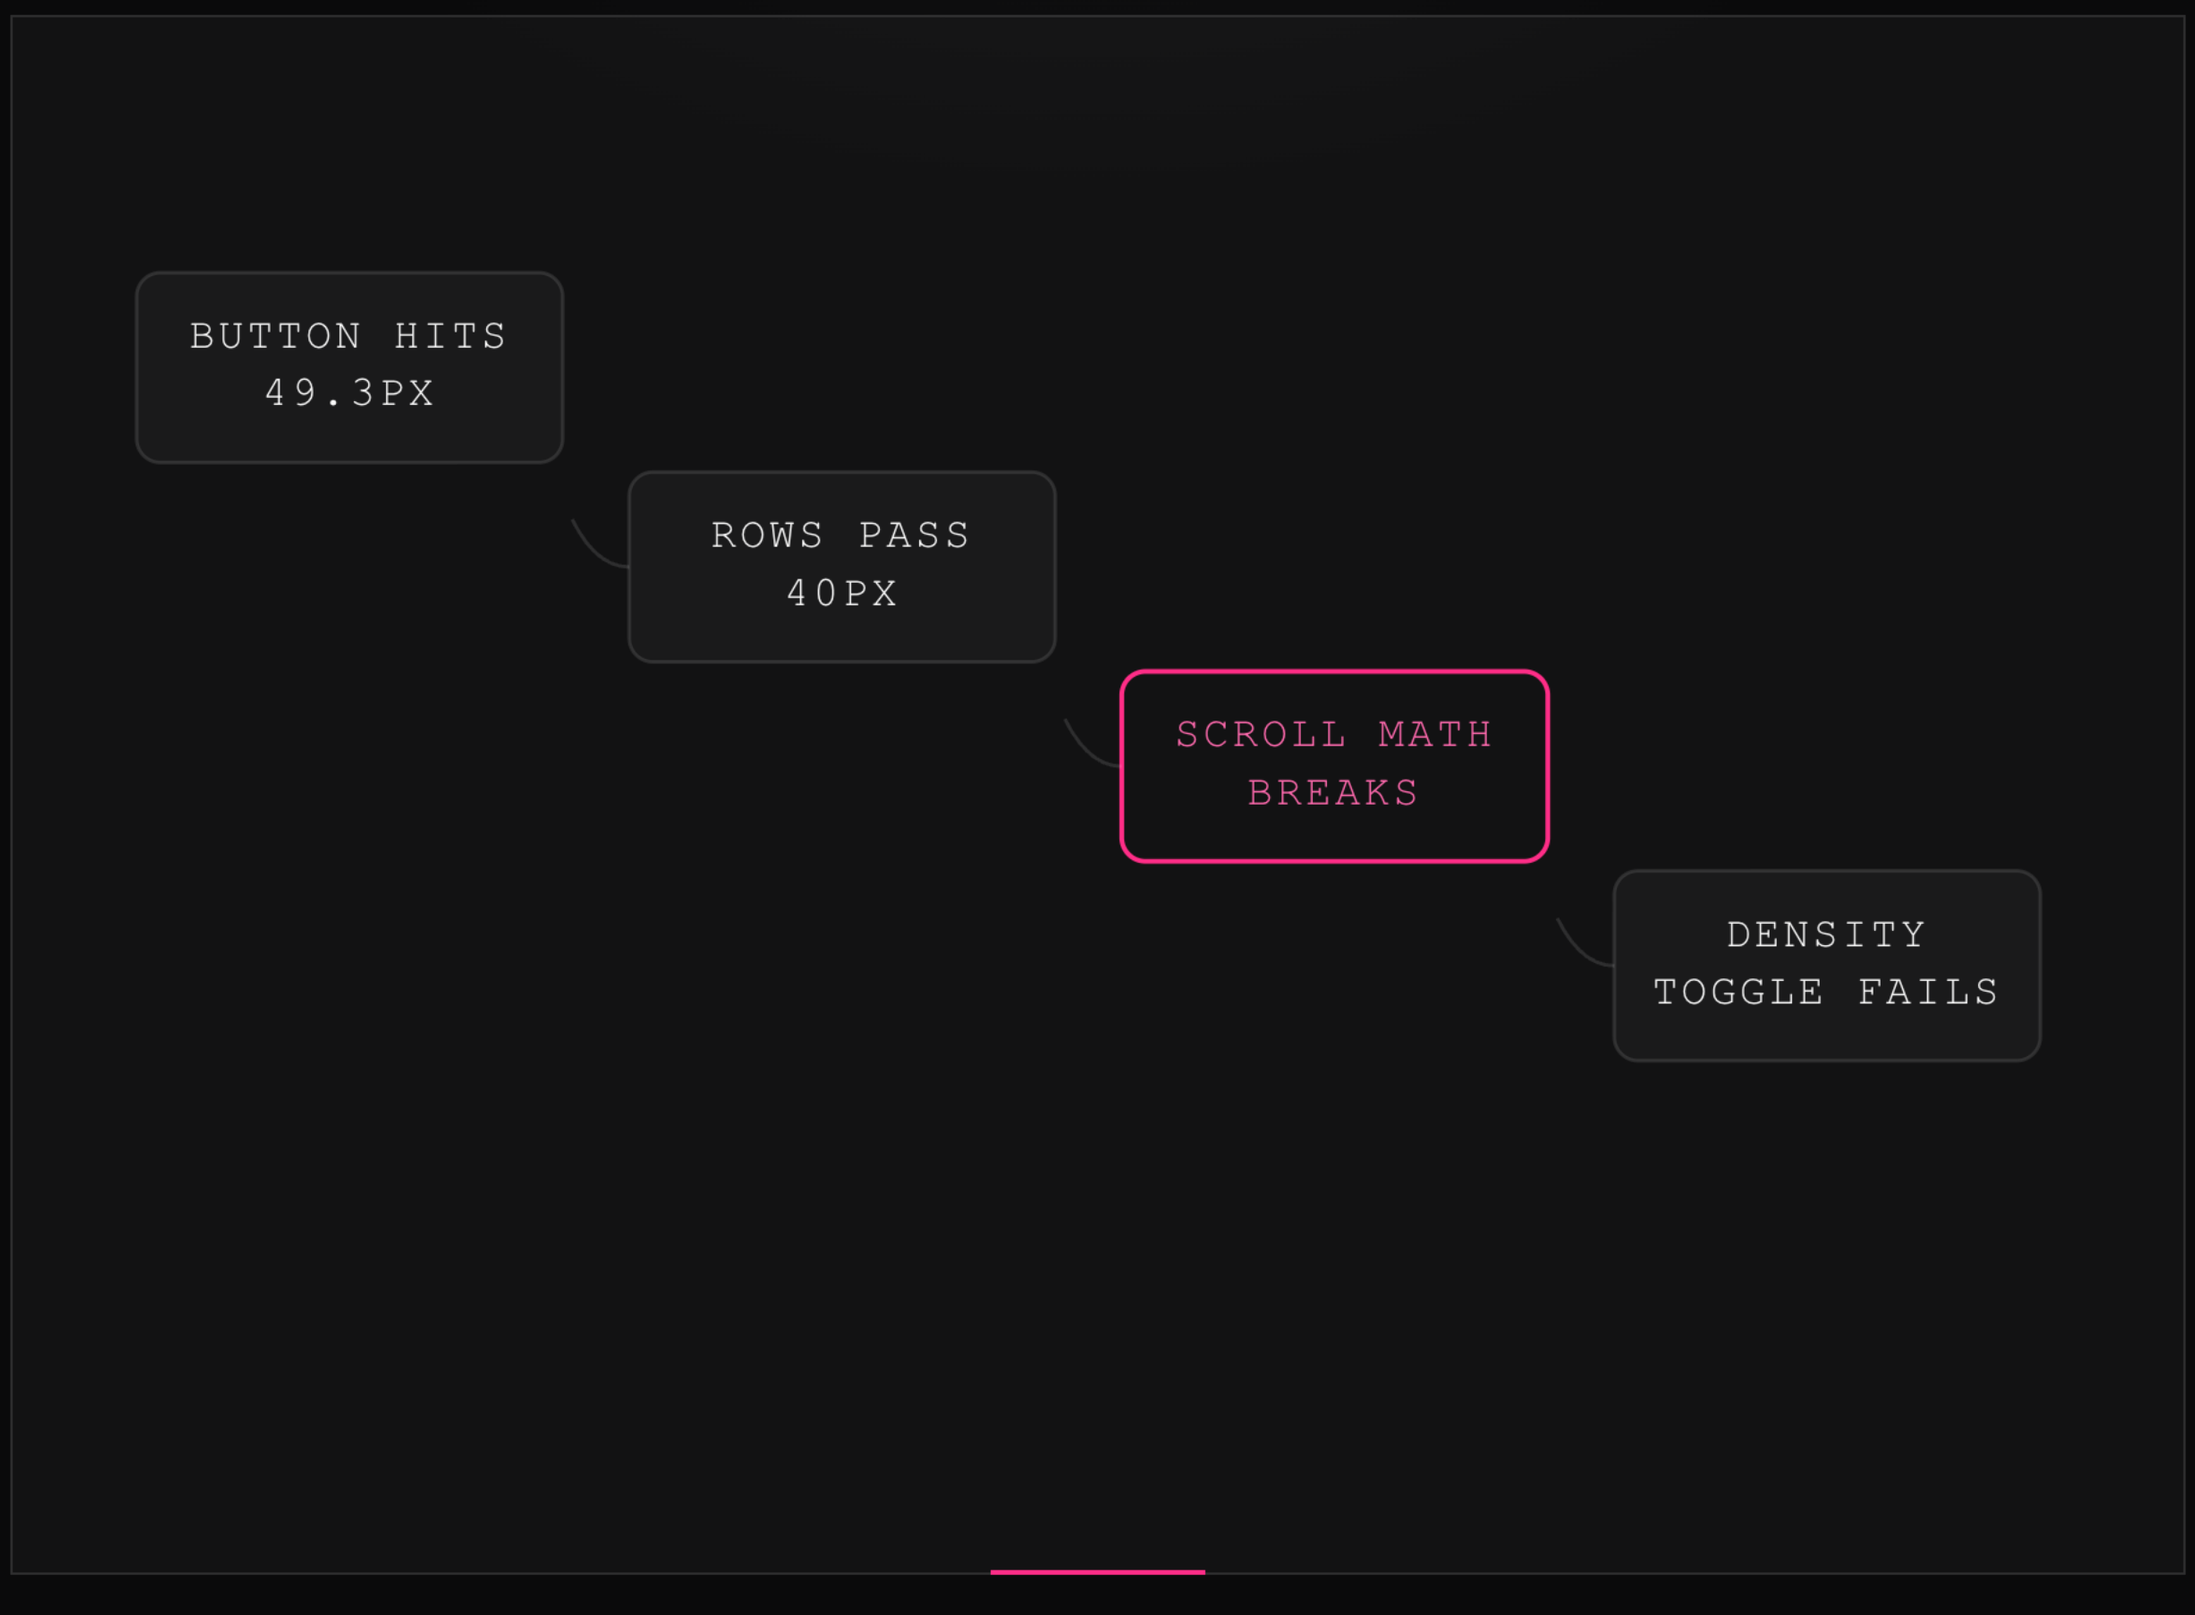

EXHIBIT 03 · THE CHAIN

# A growing control breaks the scroll math

Virtualization assumes every row is the same height. The 49.3px button inflated every row, which broke the density toggle and the virtualizer's scroll math.

BEFORE

— TWO-LINE DUE BUTTON

— 49.3PX TALL

VS

AFTER

• SINGLE LINE, CAPPED

• ROWS MEASURE 40PX

• EXHIBIT 04 · BEFORE AND AFTER

# The fix capped the control, not the row

Before: a two-line due button at 49.3px. After: a single-line, height-capped due button scoped to the sheet table.

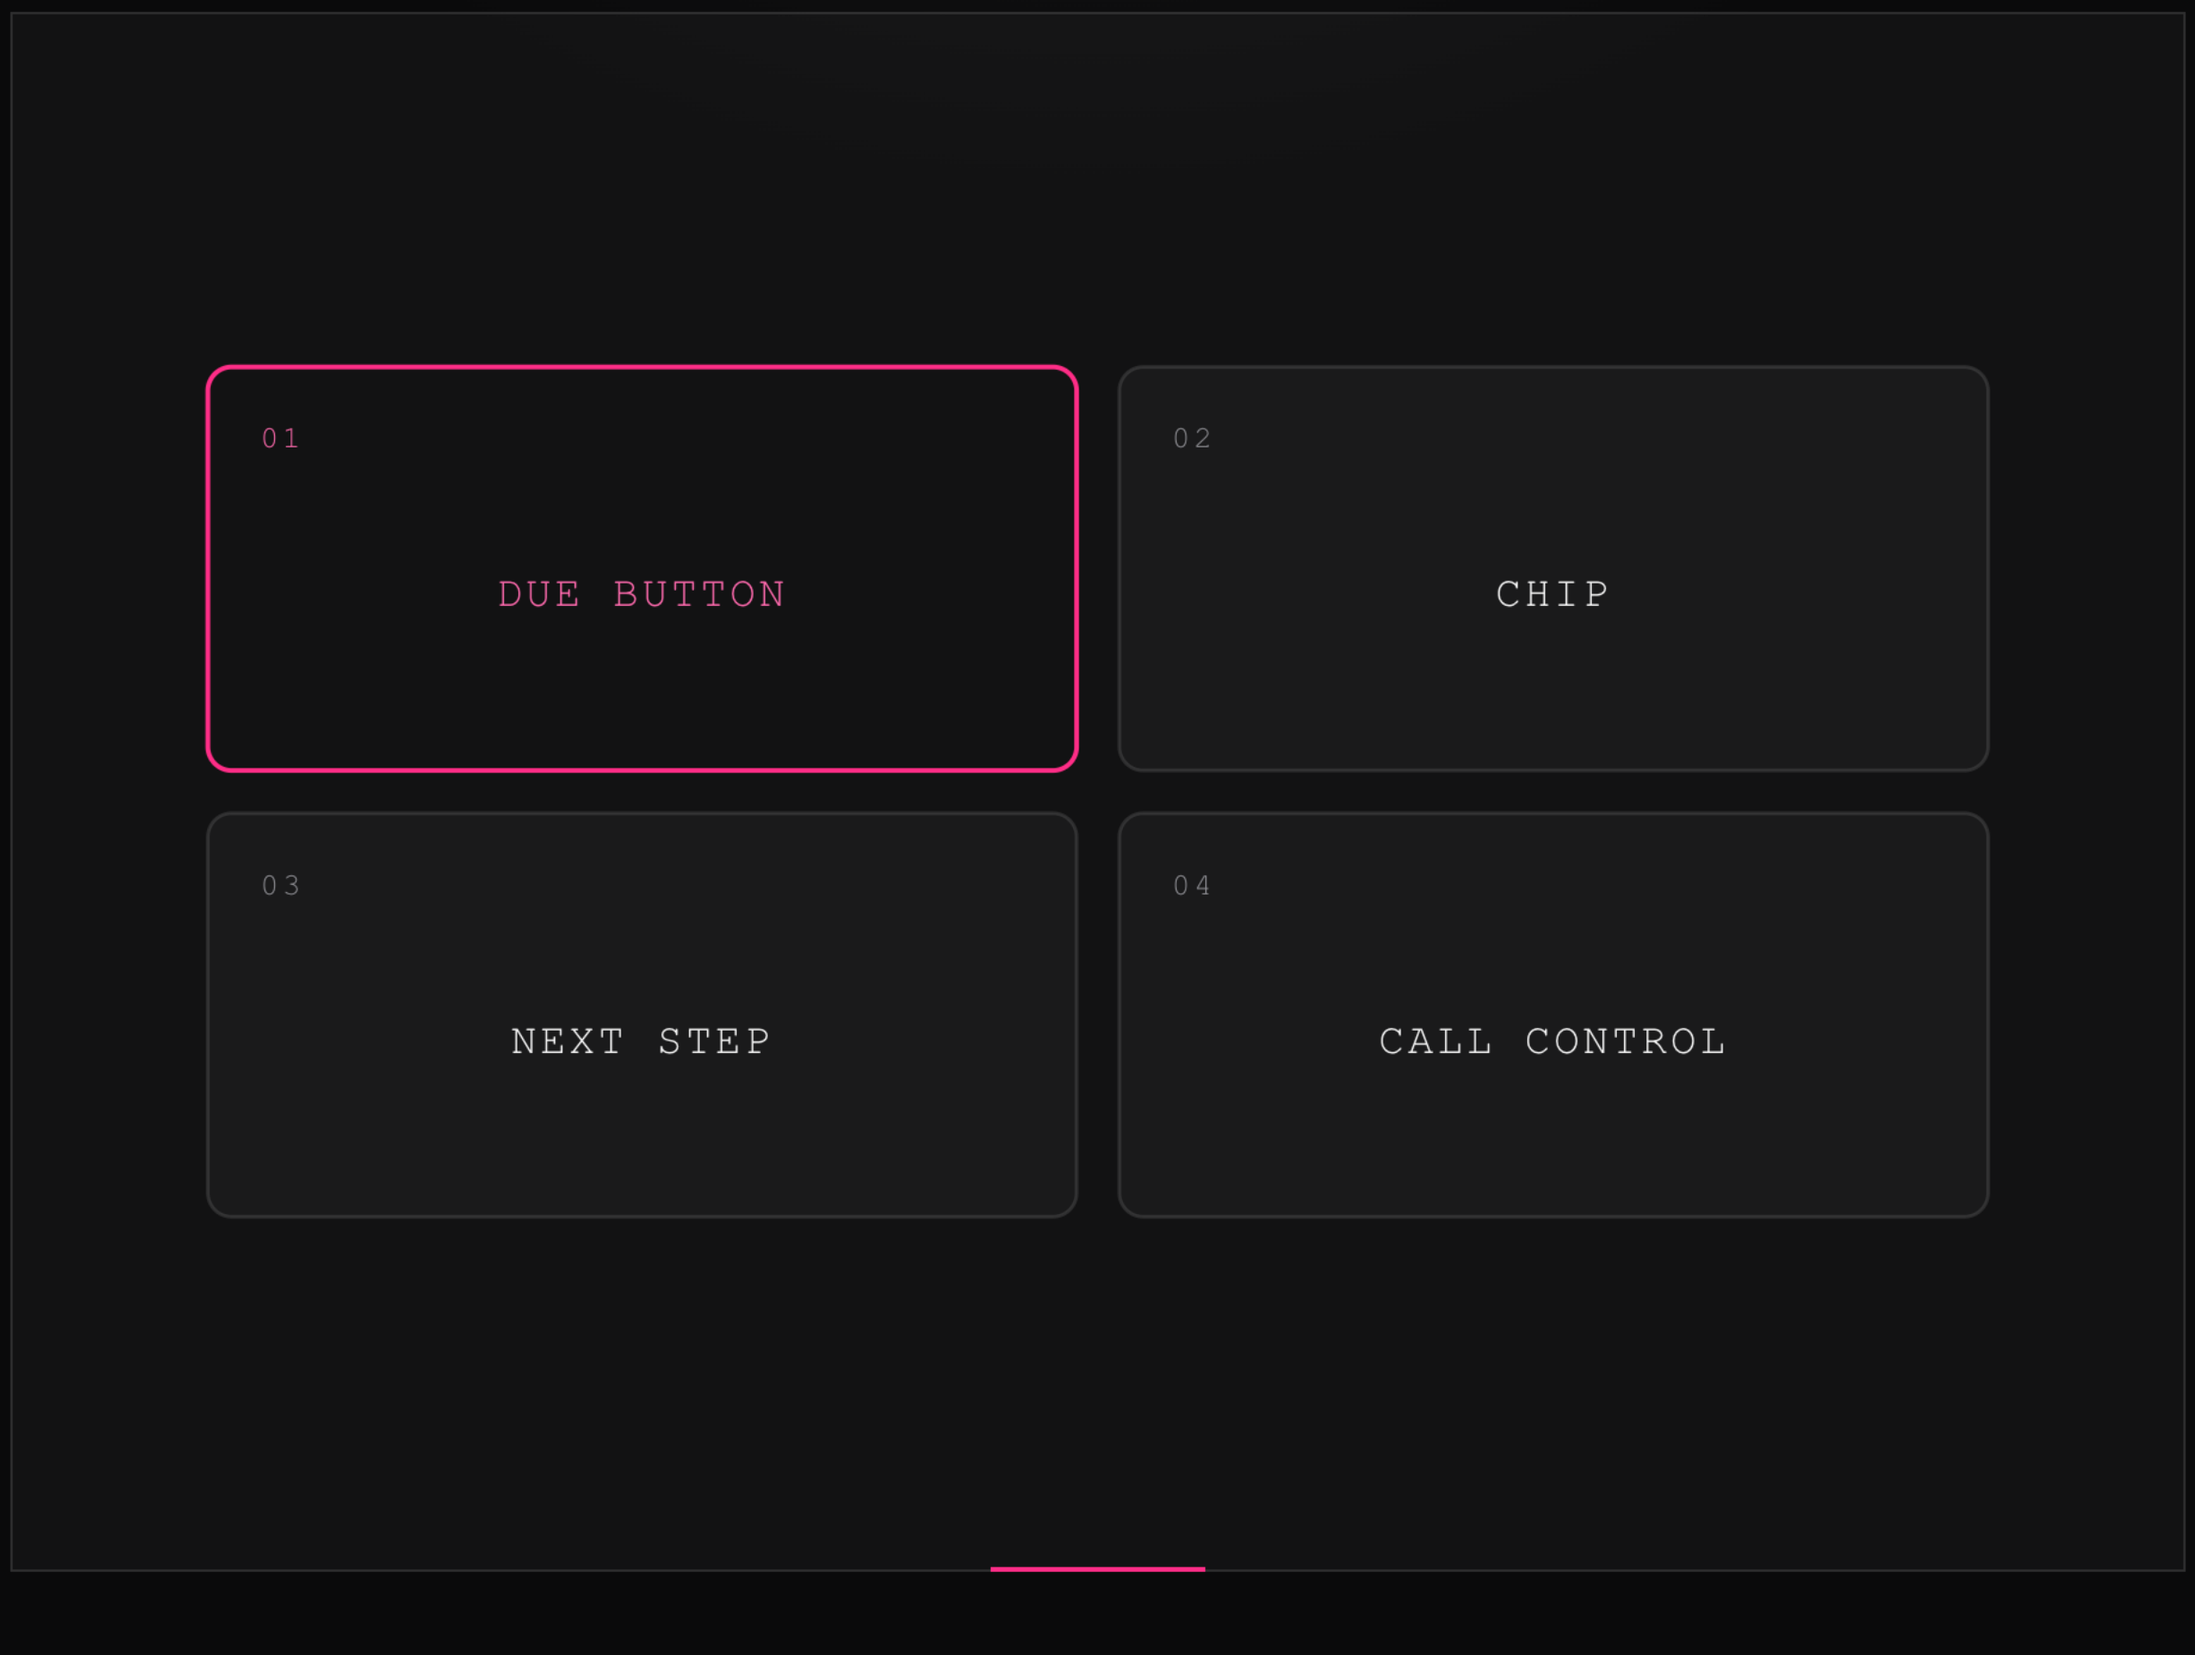

EXHIBIT 05 · THE CAPPED CONTROLS

# Four controls got a height cap

The due button got a single-line cap. The chip, next-step and call controls got caps too, all scoped to the sheet table.

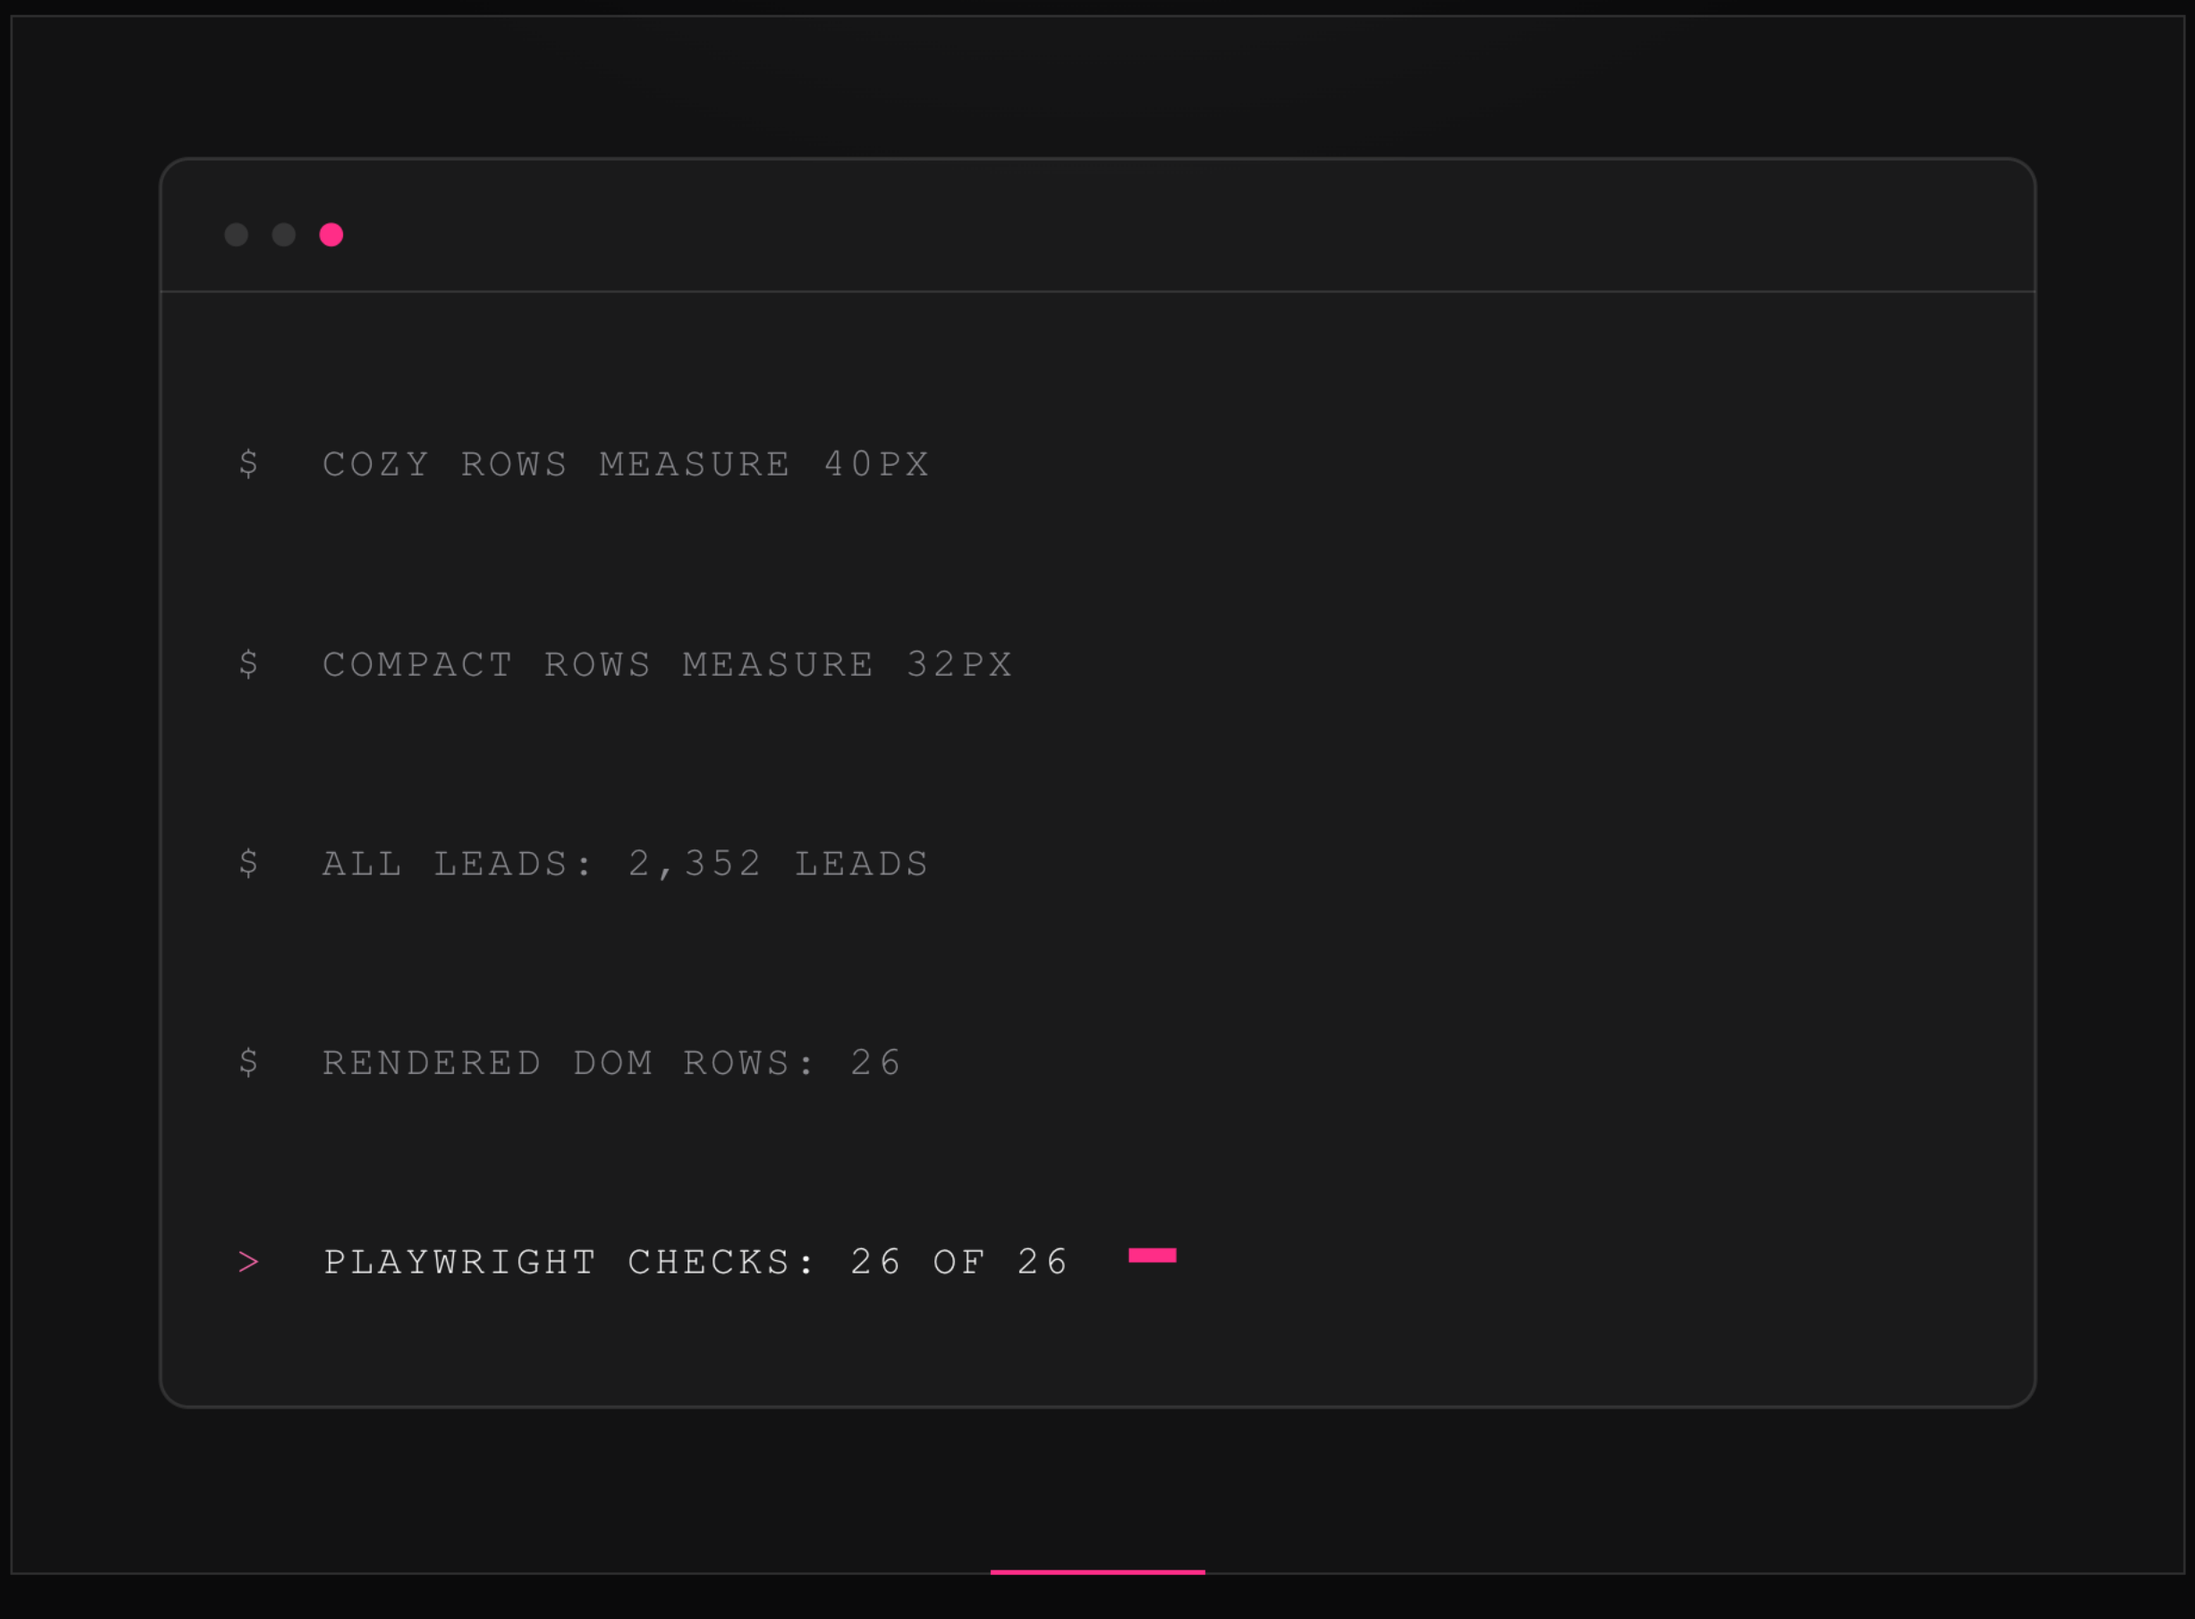

EXHIBIT 06 · MEASURED, NOT ASSUMED

# Measure the rows. Don't trust the CSS.

Rendered rows measured exactly 40px in cozy and 32px in compact. QA passed 26 of 26 Playwright checks on real data, with 26 virtual DOM rows for 2,352 leads.

# Cap every control in a virtual row

Then measure the rendered rows against your row height.

MEASURE YOUR ROWS
