# A Flag Replaced My Permission System \_

One switch now does what took me an hour to hand-build.

RUN SESSION —

arhem@verydian:~/August 27 release\$ step 2

# The flag itself, as shipped

--restricted strips an agent to file tools only. No command execution, no code execution, one switch.

STDOUT

\$ --RESTRICTED

\$ FILE TOOLS ONLY

> NO EXECUTION

```
arhem@verydian:~/the old setup$ step 3
```

# What I used to build by hand

A manual tier system: file-only access, read plus file access, and full execution, configured separately every time.

```
arhem@verydian:~/the_replacement$ step 4
```

# What the flag actually replaces

The bottom tier only. Hand-built config and testing versus one command-line switch for read-only access.

STDOUT

BEFORE

— HAND-BUILT CONFIG

— MANUAL TESTING

VS

AFTER

● ONE FLAG

● ZERO SETUP

arhem@verydian:~/still hand-built\$ step 5

# What a single flag doesn't cover

Tiered access across subagents. A researcher, a writer, and an editor each still need different limits.

# Still hand-building read-only access?

Use the flag. Spend your time on the governance layers above it.

TRY --RESTRICTED
