

I built our content engine with Claude Code

Six weeks. Zero frontend engineers. Here's what that actually looked like.

02 ·

What the system actually does

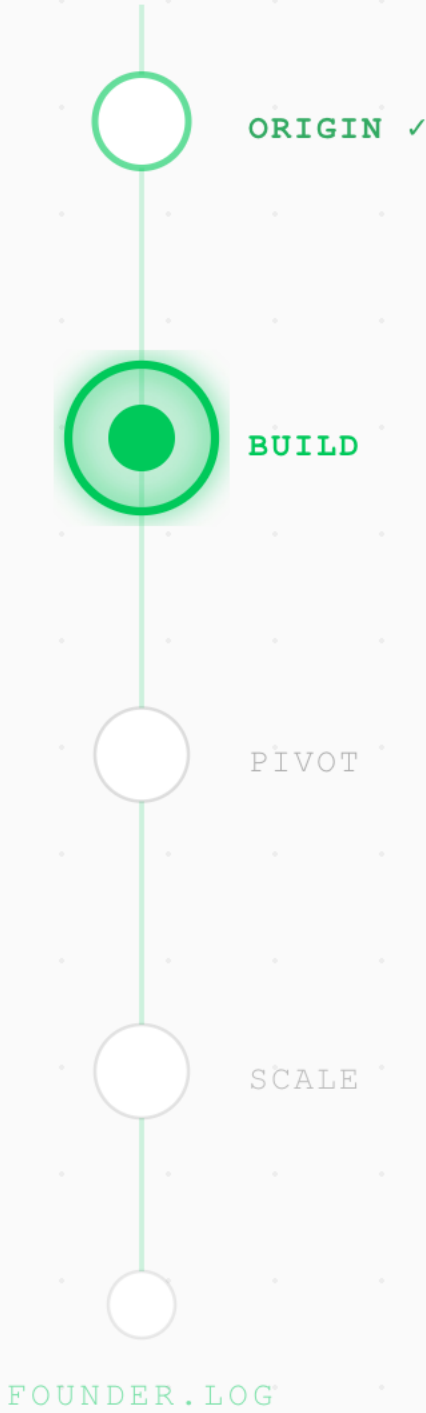

Renders LinkedIn carousels as PDFs, Instagram as PNGs via Puppeteer. Cycles template variants week-over-week. Publishes slides directly to Notion with a full content calendar. Runs on cron every Monday — untouched.

03 ·

Claude Code wrote the TypeScript. I wrote the spec.

That distinction is everything. The Puppeteer pipeline, PDF bundling, Notion file upload API, variant cycling logic — all written in sessions I'd have spent weeks on alone. The thinking was mine.

04 ·

Go in vague, come out vague — it's that simple

When I had a clear architecture in my head, Claude Code moved fast and got it right. When I was unclear on what I wanted, the output reflected that. It amplifies clarity.

05 ·

The gap between design and production shrank dramatically

That gap used to cost weeks — scoping, writing, debugging, integrating. Now it costs days. Claude Code didn't replace the thinking. It removed the execution tax on good thinking.
